This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

+ *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.

+ *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.

+ *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.

+ *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at `http://books.google.com/`

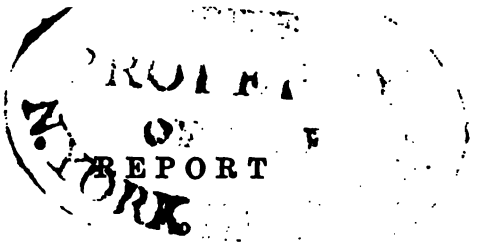
INDEX of DISTRICTS, referring by Numbers to the several TABLES of ABSTRACTS 189



REPORT

The Right Honourable SIR GEORGE GREY, Bart., G.C.B., Her Majesty's Principal Secretary of State for the Home Department, &c. &c. &c.

General Register Office, Somerset House,
10th June 1857.

SIR,

I HAVE the honour to submit to you, in continuation of my annual statements, the Abstracts of the Births, Deaths, and Marriages in England and Wales during the year 1855.

1855.—MARRIAGES, BIRTHS, AND DEATHS.

304,226 persons were married; the births of 635,043 children, not including the still-born, were registered; and 425,703 deaths were recorded during the year. Thus 1,364,972 new names were inscribed on the national registers. Respecting each of these persons, certain important facts are registered, which when carefully collated, throw light upon many subjects of great public interest.

The natural increase of the population by the excess of births over deaths in the year was 209,340; or it was at the rate of 1·121 per cent. on the population. The increase is greater than the annual increase of the two previous years by several thousands.

The number of marriages decreased; and the persons married were 15,228 less in number in 1855 than in the previous year. The number of births exceeded by 638 the 634,405 births in the previous year. The deaths were 12,202 less numerous than the deaths in 1854.

176,807 emigrants embarked from the ports of the United Kingdom during the year 1855. About 62,906 of the number were of English or Welsh origin, of whom 27,833 sailed to the United States, 4991 to the North American colonies, 29,868 to the Australian Colonies, and 214 to all other places. Of the 62,906 persons about 24,997 were adult males, and 22,545 adult females; 6769 were males aged 1 to 14 years, and 6470 were females aged 1 to 14; and 2125 were infants.*

* These results have been derived from the following numbers published in the Appendix to the Sixteenth Annual Report of the Emigration Commissioners.

Summary of Emigration from the United Kingdom, 1855.

Adults.		Children aged 1 to 14.		Infants.	Not stated.	Total.	Native Country of Emigrants.				
M.	F.	M.	F.				English.	Scotch.	Irish.	Foreigners.	Not stated.
65,363	56,960	17,700	16,919	5,557	12,318	176,807	57,132†	14,037	78,854	10,554	16,230

† Of this number of English, 25,278 sailed to the United States; 4,533 to North American Colonies; 27,127 to Australian Colonies; and 194 to other places. In the statement in the text the numbers which appear in this Table under the head of "Not stated" have been distributed proportionally over the other heads.

The annual rates of the year 1855 were such, that to 100 persons living*, there were marriages ·810, persons married 1·620, births 3·380, deaths 2·266. The rate of marriage was below the average; the rates of birth and of death were slightly above the average of the eighteen years 1838–55. *One* marriage took place to 123 persons living, and consequently *one* person was married to 62 living; *one* child was born alive to every 30 persons living; *one* person died to every 44 living.

The observations now extend over eighteen years; and the resulting average rates for England and Wales are to 100 persons living, 1·631 persons married annually, 3·276 births, 2·246 deaths; or 1 in 61 of the population is married, 1 in 31 is born, 1 in 45 dies annually.

MARRIAGES.

127,751 marriages were celebrated according to the rites of the Established Church, and 24,362 marriages according to other forms. Of 100 marriages, about 84 take place in the churches and chapels of the Establishment. Only 14 marriages were by special licence; more than 20,386 by licence, 99,546 after banns, 3804 by superintendent registrar's certificate. The mode of marriages was not stated in 4001 instances by the clergymen. If we take the proportion in 100 on the 123,750 distinguished cases, 16·5 were by licence, 80·4 by banns, and 3·1 by superintendent registrar's certificate.

The cost of the marriage licence is about 50*s.*; the common fee for the publication of banns is 1*s.* The revenue of the ecclesiastical officers under the two heads must have been about 52,613*l.* for licences, and 5138*l.* for the publication of banns.

The decrease in the marriages by banns was 5504 on 105,050, or more than 5 per cent.; the decrease in the marriages after licence was 662 on 21,048, or more than 3 per cent. The poorer classes evidently felt the

1855	18,766,914	153118	304236	636048	425703	209640

† The Population has been deduced on the assumption that the annual rate of increase was uniform; viz. 1·220 per cent. in each of the 10 years 1841-51, and 1·326 per cent. in each of the 3 years 1838-40. For 1853-55 the increase of Population has been obtained by taking the excess of births over deaths in the four quarters ending June 30th, in each year. The results, by the latter method, will probably be found now to be more correct than those deduced on the hypothesis that the population increased at the same rate in 1851-2-3-4-5, as it did in 1841-51.

* By taking the numbers living to be 100,000, the numbers may be read without the decimal points.

pressure of the times more severely than the rich; and they abstained from marriage to a greater extent.

The marriages in registered places of worship belonging to Roman Catholics were 7344; to Independents, Baptists, Methodists, and other Christian denominations 9296, to Quakers 57, and to Jews 224. The marriages among the Roman Catholics attained their maximum (8375) in 1853; they fell to 7344 in 1855, or more than 12 per cent. The number (10,149) among other Christian denominations not of the Established Church was at its maximum in the same year, and fell to 9296 in 1855, or 8 per cent.; while the marriages according to the rites of the Church of England declined 7 per cent. These rates must have been modified by the comparative wealth of the members of the different communities.

High prices of wheat depress marriage among the classes (five out of six) who marry by banns, to a greater extent than they depress marriage among the remaining sixth of the people marrying by licence. Consequently, as the annual average price of wheat was higher (74*s.* 8*d.*) in 1855 than it was in any of the 15 years since 1841, the proportion of marriages by *banns* to the marriages by *licence* should be lower than it was in any of those years. This is found to be the case, and the proportion was 4·883 marriages by banns, to 1 marriage by licence in 1855. The principle that was announced in the last report, is thus confirmed by the experience of another year. (See Table *a.*)

Marriages of minors.—8386 young men and 27,207 young women married under 21 years of age; of 100 men who married nearly 6 were minors, of 100 women 18 were minors; or taking 100 persons (50 men and 50 women), 12 married under 21 years of age.

TABLE (*a*).

YEARS.	MARRIAGES.		Estimated to 100 persons living.		Price of Wheat per Quarter.
	To 100 persons living.	By Banns to *one* Marriage by Licence.	*Marriages* of the higher and middle Classes.	*Marriages* of the Artizans and Labourers and other Classes.

1845	·860	5·799	·126	·734	50 10
1848	·797	5·121	·130	·667	50 6
1843	·759	5·490	·117	·642	50 1
1849	·808	5·429	·126	·682	44 3
1852	·872	5·472	·135	·737	40 9
1850	·860	5·666	·129	·731	40 3
1851	·858	5·591	·130	·728	38 6

The number of young women marrying under age has increased rapidly within the last seven years. The proportion fluctuated only from 13·16 to 13·73 per cent. in the seven years 1841–47. It then rose from 14·06 in 1848, and 15·75 in 1851 to 16·99 in 1852; 17·76 in 1853; 18·03 in 1854; and 17·89 in 1855. The proportion of young men to young women who marry under the age of 21 is as 1 to 3; but the early marriages of men increased nearly to the same extent as the early marriages of women.

The proportion of early marriages of women exceeded 20 in 100 in the following counties; and it was 21 in the county of Northampton, 24 in Huntingdon, 25 in Bedford, 23 in Cambridge, 21 in Essex; it was 28 in Stafford, 26 in Durham, and 22 in Monmouth, the great coal districts; 21 in Nottingham, 21 in Derby, 21 in Lancaster, 25 in the West Riding of Yorkshire, 21 in the East Riding of Yorkshire.

The *increase* of the proportional number of marriages of young women under the age of 21 was great in Cornwall, Durham, and Monmouthshire and Wales; in Herefordshire, Shropshire, and Worcestershire; in Nottinghamshire and Derbyshire; in the East Riding of Yorkshire, Northumberland, and Cumberland. And the increase was not only in the proportional, but also in the absolute number of such marriages. London, Middlesex, Devon, and North Wales have remarkably few marriages of minors.

Re-marriages. — 21,940 widowers and 14,435 widows re-married; 14,280 widowers married spinsters, and 7660 married widows, and 6775 widows married bachelors. The proportional number of widowers (14·42 per cent.) and widows (9·49 per cent.) exceeded the average.

In London, Bucks, Norfolk, Wilts, Notts, Chester, Lancaster, the East Riding of Yorkshire, more than 15 in 100 men who married were widowers. In London, Hants, Hereford, Stafford, Warwick, Lancaster, Durham, and Monmouth, more than 10 in 100 women who married were widows.

Signatures of persons married.—44,846 husbands and 62,672 wives made their marks; while 107,267 husbands and 89,441 wives wrote their names in the marriage registers. A certain number of the women who

1853	·894	1·788	3·338	2·288	112	56	30	44
1854	·858	1·716	3·407	2·352	117	58	29	43
1855	·810	1·620	3·380	2·206	123	62	30	44
Mean . .	·816	1·631	3·276	2·246	123	61	31	45

NOTE.—The Table may be read thus:—In the year 1838 to every 100 persons living there were ·771 marriages or 1·542 persons married, 3·029 births, 2·236 deaths; the number of persons living to every marriage, person married, birth or death, was 130, 65, 33, and 45 respectively. By disregarding the decimal points the Table will show the proportion to every 100,000 persons living. A correction for increase of population has been made in calculating the above results.

make their marks are deterred by timidity from writing their names; upon the other hand many thousands of those who write their names, write very badly, and are evidently little practised in the art of writing. The means of education must still be deplorably defective in England and Wales, when we find 41 in 100 women, and 29 in 100 men making crosses instead of writing their names in the registers of their marriages. It is consolatory to find that within the fifteen years 1841 to 1855, the proportion of men who write their names has increased from 67·3 to 70·5; and the proportion of women has increased to a still greater extent; namely, from 51·2 to 58·8 in 100.

Each marriage constitutes a family; and to the family the fact that one of its members can read and write, is of more importance than the fact that both can read and write. Now as 107,267 men and 89,441 women wrote their names, it is evident that the 196,708 may have been so distributed in pairs, as to leave no pairs in which neither the husband nor the wife could write.

Such a combination, however, does not take place. But if it is assumed that the men and women who can write, and that the men and women who cannot write, have no tendency to intermarry greater than that which

disposes them to marry those who are not in the same class as themselves, it follows from a well-known mathematical formula* in the calculus of probabilities, that the 152,113 married couples would have been distributed as they are in the second column of the annexed Table.

——	Numbers if no selection had existed.	Numbers as given in the registers.	Difference.
Husband AND wife *write* - -	63,072	76,734	+ 13,662
Husband OR *wife writes* (mixed marriages) - - - - -	70,564	43,240	− 27,324
Husband AND wife do not write -	18,477	32,139	+ 13,662
(1)	(2)	(3)	(4)

Here the indisposition to mixed marriages is evinced in the fact, that instead of 70,564, there were only 43,240 couples in which *one* or other of the two could write; half the difference of those numbers or 13,662 being added to the 63,072 couples in which both husband and wife write, and the other 13,662 to the 18,477, in which neither the husband nor the wife writes. As the poor intermarry, and the wealthy intermarry, so naturally the classes who cannot write intermarry; and thus, instead of having the greatest number possible of cases in which at least *one* writes, there is not the due mathematical proportion of such cases, but in 32,139 of the new families, neither the father nor the mother will be able to write.

The number of married couples in England was about 3,150,470 in the year 1855. It is certain that at the date of their marriages, elementary

† The proportion of Widowers and Widows in the Year 1841 is for the September and December quarters only.

* Let m denote the number of men who are able to write their names, and m' the number of men unable to write their names; also let f denote the number of women able, and f' the number not able to write; then putting $\frac{m+m'=M}{f+f'=F}$ and multiplying the terms of the two equations into each other, we have $mf+m'f+mf'+m'f'=MF$

$$\therefore \frac{mf}{MF}+\frac{(m'f+mf')}{MF}+\frac{m'f'}{MF}=1$$

The first term gives the proportion of combinations in which both write, the second in which the man or the woman writes, the third the proportion in which neither writes.

education was less diffused even than it is in the present day, consequently the *proportion* of the cases in which neither the man nor the woman writes will be greater among these 3,150,470, than it was among the couples married in 1855, or even in 1847; but upon applying the proportions deduced from the facts of 1847, it is found that in 1855 there must have been nearly 1,488,000 families in which the husband and wife could both write their names; 905,912 families in which one could write,

TABLE V.—ENGLAND. MARRIAGES.—PROPORTIONAL Number of MARRIAGES in the several Counties of England during the Year 1855; of Persons who signed their Names; of Persons not of full Age; and of the Re-marriages of Widowers and Widows.

the other could *not* write; and 756,558 families in which neither the husband nor wife, the father nor mother could write their names. How defective the rest of their elementary education must have been, is self-evident.

Registered buildings for the solemnization of Marriages.—The number of these buildings on the register at the end of the year 1855 was 3658: 1280 belonged to the Independents, 837 to the Baptists, 642 to the various sects of Wesleyan Methodists, and 440 to the Roman Catholics.

NOTE.—The above numbers are for the Counties *proper*, and not for the "Registration Counties."

BIRTHS.

Births (exclusive of still-born).—The births of 635,043 children were registered in 1855, and the births were 3·380 to 100 of the population, or 1 birth to every 30 of the population. The births fluctuate little; but the ratio of the births registered to the population (100) has risen from 3·029 in 1838 to 3·380 in 1855. This increase is partly due to improved registration.

TABLE VII.—ENGLAND. BIRTHS, 1855.—NUMBER and PROPORTION of Male and Female Children born *in* and *out* of Wedlock.

No.	REGISTRATION COUNTIES.	Male Children born.	Female Children born.	Born in Wedlock. Males.	Born in Wedlock. Females.	Born out of Wedlock. Males.	Born out of Wedlock. Females.	MALES born to every 100 FEMALES born.	MALES born *in Wedlock* to every 100 FEMALES so born.	MALES born *out of Wedlock* to every 100 FEMALES so born.	CHILDREN born *out of Wedlock* to every 100 Births.

The ratio of births to the population (100) is greatest in Durham (4·437) and Staffordshire (4·305) among the collieries. It is least in Westmorland (2·712), Hereford (2·720), Devon (2 732), Rutland (2·778), Berks (2·832), Somerset (2·836), Hertford (2·839), and Oxford (2·850). The births have decreased in these counties since 1850; at the same time they have increased in Durham and Staffordshire.

TABLE VIII.—ENGLAND. BIRTHS 1855.—PROPORTIONAL Number of BIRTHS registered in each Registration County in the Year 855, and in each Season of the Year, or the Number of Births in each Quarter to 000 Births in the Average Quarter.

No.	REGISTRATION COUNTIES.	Births to 100 Persons living.	Proportional Number of Births registered.* In the Average Quarter assumed to be 1000.	In the First Quarter ending March 31.	In the Second Quarter ending June 30.	In the Third Quarter ending Sept. 30.	In the Fourth Quarter ending Dec. 31.

44	North Wales	2·859	1000	1028	1094	980	898

* In calculating the proportional number of births in the four quarters a correction has been made for the difference in the number of days in each quarter.

Sex.—323,960 boys and 311,083 girls were born in the year. 104 boys were born to every 100 girls. In the county of Derby the boys were 101·5 to 100 girls, in Monmouth 101·5, in Leicester 101·9 to 100, in Cambridge 108·1, Northumberland 108·4, Rutland 108·5, Oxford 109·8 to 100 girls. Derby (101·5) and Oxford (109·8) present the extremes. In London the proportion of boys was 103·5; it is generally below the average of England and Wales.

Seasons.—The births were most numerous 166,225, in the first quarter; least numerous (148,841) in the last quarter of the year. Putting 1000 to represent the average number of quarterly births, the proportional numbers in the quarters of 1855 were 1060, 1044, 966, and 930. The influence of the seasons varies in the several counties as shown in Table VIII.

Children born out of wedlock.—40,783 children, namely, 20,871 boys and 19,912 girls were born out of wedlock; giving the proportion of 6·4 such children to every 100 children born alive, nearly 1 to 15. The proportion is thus lower than it was (6·8) in the three years 1850–1–2. The counties in which the greatest proportion of births out of wedlock occur are Norfolk (10·1), Hereford (9·9), Salop (9·8), Cumberland (10·6), and Westmorland (10·0); while Kent (5·2), Hants (5·8), Northampton

1853 - -	4,340,647	612,391	14·1
1854 - -	4,387,916	634,405	14·5
1855 - -	4,435,699	635,123	14·3

(5·8), Huntingdon (4·6), Devon (5·7), Cornwall (5·1), Gloucester (5·5), Warwick (5·4), Durham (5·6), and Monmouth (4·6) are the counties in which the proportion of births out of wedlock is lowest; if we except London (4·0), where all the illegitimate births are probably not registered, and the parts of Middlesex and Surrey out of London.

The proportion of children born out of wedlock to the number of unmarried women of the ages 15–55 in the several counties, will be found for one year in my Fourteenth annual Report (p. xii).

DEATHS.

425,703 persons died in the year; and the annual rate of mortality was 2·266 per cent. Since the year 1838 the mortality was higher in seven years than this rate; it was 2·288 in 1840, 2·306 in 1846, 2·471 in 1847, when influenza was epidemic; 2·306 in 1848, 2·512 in 1849, when cholera was epidemic; 2·288 in 1853, and 2·352 in 1854, when cholera was again epidemic. The mortality was lowest in 1845 and 1850, when the rates were 2·089 and 2·077. The range of the mortality in eighteen years was from 2·077 (*one* in 48) to 2·512 (*one* in 40); and the average rate of the eighteen years was 2·246. Thus the minimum rate fell only ·169 below the average; while the maximum rate was ·266 *above* the average rate.

The fluctuations in the rate of mortality are subject to this law, that the excess in the mortality from zymotic diseases raises the mortality much above the average, while the reduction in the mortality never falls in a healthy year to an equal extent.

Sex.—The mortality of males was at the rate of 2·348 per cent., of females 2·187 per cent. in the year; and these rates are to each other as 107 to 100. So if 100 females die out of a given number of females, out of an equal number of males 107 males die. But the number of females in England and Wales is greater than the number of males, and the deaths of males (216,587) were to the deaths of females (209,116) in the

---

TABLE XL.—ENGLAND. DEATHS.—ANNUAL RATE of MORTALITY of Males and of Females, 1838–55.

YEARS.	DEATHS. To 100 Males living.	DEATHS. To 100 Females living.	Deaths of Males to 100 Deaths of Females.	Of equal Numbers living, the Number of Male Deaths to every 100 Deaths of Females.

Average of 18 years, 1838-55	2·327	2·165	103	108

The Table may be read thus:—In the year 1838 to every 100 males living there were 2·335 deaths of males; to every 100 females living there were 2·183 deaths of females; and to every 100 females who died there were 105 deaths of males. The last column shows the *relative* mortality of *males* and *females;* and that out of *equal numbers living* the deaths of males were 109 to every 100 deaths of females in 1838.

proportion of 104 to 100; or nearly in the same proportion as the sexes in the births (104 boys to 100 girls).

Note.—In deducing the results given in this Table a correction has been made for increase of population, based on the numbers enumerated in 1841 and 1851, on the assumption that the increase was uniform in each year (1841–1851). *Since* the Census of 1851, as no satisfactory data exist for ascertaining the progress of the population, which has been much interfered with by emigration and other causes, the increase has been taken to be approximatively represented by the excess of births over deaths registered in each respective year ending June 30th.

Localities.—The Tables XII., XIII. show the rates of mortality in the several counties, year by year from 1845 to 1855, together with the averages of two periods of ten years, and the density of the population.

Ages.—The mortality varies at every year of age, and it decreases from the date of birth to the age of 10–15, at which point it begins to increase. Thus the average mortality among male children under 5 years of age was at the rate of nearly 74 in 1000; at the age of 5–10 it was 9; at 10–15, 5 in 1000; in the next period of life 15–25 out of the same average numbers living (1000) 8 die, and in the following decennial intervals of age the mortality is nearly 10, 13, 19, 32, 68, 150, 303, and 452; so that to every 1000 old people of the age of 95 and upwards, 452 die annually. The deaths at different periods of life are not always from the same diseases, and where the same disease is fatal at every age, its degree of fatality varies. The zymotic diseases fall with unusual severity upon

---

TABLE XIII.—DENSITY OF POPULATION 1841–51, and the ANNUAL RATE OF MORTALITY per Cent. in each County during the 10 Years 1843–1853 (excluding 1849); in the Cholera Epidemic Years, 1849 and 1854; and in 1855, arranged according to the Mortality in 1843–1853.

* The *Hectar* is the unit of land measure in the Metrical system, and it is equal to a square of 100 *Meters*, = 109·3633 yards, to the side. It is equivalent to 2·471143 (nearly 2½) Statute *Acres*, or, expressed in other terms, a Statute *Acre* represents ·404671 (rather more than 4-10ths) of a *Hectar*.

people of particular ages, as it will be seen that cholera did in 1849 and 1854, upon comparing the mortality at the twelve periods of life in Table XIV.

The mortality was in 1855 below the average of the preceding ten years at all ages under 45; after the age of 55 the mortality was above the average of those years. This higher mortality of old people was probably the result of the extreme cold in the earlier months of 1855.

In the three early periods of life (0–15) the mortality of *males* exceeds the mortality of *females;* as is also the case after the age of 35 up to extreme old age; but from the age of 15 to 35 the mortality of females is in excess. The same observation applies with very little exception to the decennial average, as well as to 1855.

The seasons.—The winter of 1855 was a remarkably cold season, and the deaths amounted to 134,542. The average number of deaths in the five previous winter quarters was 108,022; so that the cold was probably the cause of more than *twenty thousand* deaths. The deaths in

The Table may be read thus:—Of 100 Males living of the age of 35 and under 45, 1·272 died in 1846, 1·436 in 1847, and so on for other years, a correction for increase of Population having been made for each Age in each Year; and the deaths of persons whose ages were not returned have been distributed proportionally over each age. The data upon which this Table is constructed appear in this or have appeared in the previous Reports, and in the Census Report. *See* Census Report 1851; and the Annual Reports of the Reg. Gen., particularly the 8th and 9th.

the summer quarter were below the average. The distribution of the mortality over the four seasons, is shown in Table XVI., where it will be seen that the average quarter being set down at 1000, the relative numbers of deaths in the four seasons were 1280, 1001, 816, and 903.

I now submit to you a brief abstract of the observations in the Quarterly Returns, which are prepared from the Registrars' statements, and published within the month immediately after the close of each quarter.

SUMMARY OF THE QUARTERLY REPORTS 1855.

*First Quarter.—January, February, March.**

The births are above and the marriages below the average numbers of the season; and as the consequence of the excessively cold weather the mortality of the quarter is the highest on record since the commencement of the civil registration.

* The numbers published in the Quarterly Reports were derived from returns furnished for that purpose by the Registrars; in the present re-publication the figures have been corrected from the annual abstracts.

Births.—166,225 children who were born alive had their names inscribed on the registers in the three months of January, February, and March. This number exceeds by twenty thousand the numbers that appear in the return for the preceding quarter, and by five thousand the numbers in the return for the corresponding first quarter of 1854. The rate of births was 3·603 per cent. The increase of births is chiefly in London, in the West Midland Counties, in the Northern Counties, and in Wales.

Increase of Population.—As the number of births was 166,225, and of the deaths 134,542, the excess indicates that the natural increase of the population was 31,683 in the first three months of the present year. In the same period 36,677, or, exclusive of 2217 foreigners, 34,460 emigrants left the ports of the United Kingdom at which the Government has Emigration officers. About 15,806 of the emigrants were of English origin; so that the natural increase by births would be diminished to this extent, if there were no compensating immigration of the Irish and Scottish population into England.

The emigration from the United Kingdom to the United States has fallen from 51,929 in the winter of 1851 to 36,067 in the winter quarter of 1854, and 18,427 in the corresponding quarter of the present year. The emigrants to the Australian colonies were, in the quarters that ended on March 31st, 1003 in 1847, 2942 in 1851, and 17,444 in 1855. The remarkable diminution in the number of emigrants from Ireland to the United States deserves attention.*

The Prices of Provisions, and the Weather.—The price of wheat has been more than 50 per cent. higher than it was in the quarter of 1853 that ended on March 31st, but 9*s.* 7*d.* per quarter lower than it was in the beginning of 1854. Beef is 25 per cent. dearer than it was in 1853, and 7 per cent. dearer than it was in 1854. Mutton has been cheaper than it was in 1853, and so have been potatoes. The meteorology, and all the peculiar characteristics of the severe weather, are described by Mr. Glaisher.

State of the Public Health.—The health of the population generally has been bad; and the mortality has greatly exceeded the average. 134,542 deaths have been registered, which is 20,000 in excess of the corrected average of the winter quarters. This addition to the ordinary mortality of winter, which is in England the most fatal season, is referable to the low temperature, with the consequent hard times, against which it is difficult for the wages classes to make an adequate provision; and in other countries, where there is no such system of relief as is administered under the English poor law, the suffering and the mortality are much greater in severe seasons than they are in England.

Persons of advanced ages among all classes have been cut off in great numbers, and have thus fallen before they had passed through the evening of life. Young children have also died in considerable numbers. Bronchitis and the congestive diseases of the lungs have been the immediate causes of death. The frost, which braces the nerves of the hardy and strong, chills the veins of the aged and weakly. The temperature of the night falls, as Mr. Glaisher shows, 11° on an average below the temperature of the day; and it is in the night undoubtedly that the respiratory organs are most frequently injured, when the water freezes in the bedrooms of houses that are not warmed by fires, or by warm air diffused by Dr. Arnott's and other admirable inventions.

The mortality in the country districts was at the annual rate of 26 deaths in 1000 living; in the town districts at the rate of 32 in 1000

---

* From a Return with which the Registrar General has been favoured by the Emigration Commissioners.

living: out of equal populations, there were *six* funerals in the towns to every *five* funerals in the country districts; and the town population is increasing by immigration much faster than the country population; so that, unless measures for the improvement of the health of the artisans, the tradesmen, and the professional and wealthy classes in towns, are immediately adopted, the lives of many, and the vigour and energies of large masses of the English population, will be lost, or for ever impaired.

The 134,542 deaths do not include deaths that have occurred at sea during the quarter, and have been entered upon the marine register, neither do they include the deaths among our soldiers abroad, as no provision has yet been made for placing the names of the men who die in the service of their country abroad, on the national registers.

The excess of mortality in the quarter is diffused over the whole kingdom; nor is it evident that the northern have suffered more than the southern counties. The deaths in London exceeded by 3247, or 1-fifth part, the deaths in the winter quarter of 1854; the deaths in the rest of England were 19,452, or nearly in the same degree in excess of that season. In the South-eastern Counties the deaths were 11,256 in the place of 8400. The Epsom district suffered from scarlatina; Guildford from small-pox and measles; Farnham from fever, measles, hooping-cough, and diarrhœa. The deaths for the first time exceed the births in Farnham. In the Bexley sub-district in Kent there were as many as forty cases of small-pox at one time: only those unvaccinated died. Scarlatina prevailed in Folkstone, Elham, Portsmouth, the Isle of Wight, Kintbury, Faringdom, and Fyfield. In the barracks at Winchester, occupied by about 2000 men, chiefly recruits and invalid depôts, 40 men have died, chiefly of acute pulmonary complaints. 46 deaths occurred in the new military hospital, Portsea. Small-pox, imported, it is believed, by the Essex rifles, was the cause of 6 deaths in Windsor, where also 2 children died in February of choleraic diarrhœa in a cleanly country cottage.

The South Midland Counties suffered from scarlatina and fever in several districts. In Oxford 25 deaths occurred from small-pox, and the deaths exceeded the births in number. In Cambridge the mortality was high. In Leighton Buzzard the deaths were nearly double the average.

In some districts of the Eastern Counties measles, small-pox, and hooping-cough prevailed. The mortality was high in Norwich and several other places. The mortality in the South-western Division, where the climate is milder, rose to the same extent. In Salisbury the deaths in the winter quarters of 1853 and 1855 were 77 and 79; and the same result is noticeable in districts all over the country, which must have been exposed to nearly the same degree of cold as the districts in which the cold winter proved most fatal. Cold under the shelter of houses in civilized states only destroys people indirectly, by inducing diseases; is chiefly fatal to the aged or feeble; and it arrests some classes of diseases; so that under certain circumstances the mortality of a district may be lower in a cold than it is in a mild winter.

Influenza was epidemic in Saint Agnes, Truro; typhus in Lerrin, Liskeard; Plymouth and the surrounding districts are still in an unsatisfactory sanitary state. In Bath, Clifton, and Cheltenham the mortality was above the average.

The West Midland Counties suffered somewhat less than the counties of the previous Division. The mortality was high in Hereford, where measles was epidemic; and somewhat above the average in Gloucester, Shrewsbury, Stafford, Worcester, and Warwick. 2094 deaths were registered in Birmingham and Aston; 112 less than the deaths in the winter quarter of 1854, but 352 more than the deaths in the winter quarter of 1853.

In the North Midland Counties the mortality was raised to nearly the same extent (1-seventh) as in the other Midland Counties; the districts of Leicester, Lincoln, Nottingham, and Derby exhibited little or no increase. Scarlatina, measles, and hooping-cough prevailed extensively in Lincolnshire.

Cheshire and Lancashire exhibited but a slight increase in the mortality. 3674 deaths were registered in Liverpool and West Derby; 3261 in Manchester and Salford; the latter number being considerably above the average.

Yorkshire suffered less than other divisions. In Leeds and Hunslet, where 1321 deaths were registered, the mortality was below the average, and in Sheffield and York the mortality was about the average.

Measles and scarlatina prevailed to some extent in the Northern Counties; the mortality was raised one-eighth part above the average. In Monmouthshire and Wales the same diseases were epidemic, and the mortality was raised about one-sixth above the mortality of the winter of 1853. The Registrar of Wrexham says:—"The severity of the winter, and the high price of provisions of all kinds, have had a considerable effect on the health of young and old people."

Second Quarter.—April, May, June.

The returns present these general results: the marriages in the quarter were below the average numbers; the births and the deaths slightly exceeded the average proportions. The severe weather, the high price of provisions, the diminution of employment in some districts, and the withdrawal of an increased number of men from the country by the army and navy abroad, account for the decrease in the marriages. The stagnation in the winter was, however, probably only temporary; for war, instead of depressing, appears to increase the industry, the invention, and the energy of Englishmen. The rapid rate of growth of the British population commenced and attained its culminating point in the last war.

Marriages.—38,549 marriages were celebrated in the quarter; or less in number by 1969 than the marriages in the corresponding quarter of the year 1854.

Births.—The births of 165,277 children were registered in the quarter that ended on June 30th, 1855; or less by 7180 than were registered in the corresponding quarter of the previous year, and more, to nearly the same extent, than were registered in the spring quarters of 1851–53. In the West Midland Counties, particularly in Staffordshire, and also in Cheshire, in Lancashire, in the West Riding of Yorkshire, and in the Northern Counties, the births of the quarter exceeded to some extent the births in the spring quarter of 1853.

Increase of Population.—As the number of births was 165,277 and of deaths 106,493, the natural increase of the English population in three months may be set down as 58,784, exclusive of the increase of immigrants from Scotland, Ireland, the Colonies, or foreign parts. In the same period 65,210 emigrants, including a certain number of foreigners, left the ports of the United Kingdom at which there are Government Emigration officers. How many of the emigrants were born in England has not yet been learnt; but 39,509 proceeded to the United States, 10,397 to British North America, 14,639 to the Australian Colonies, and 665 to other places.

The Prices of Provisions, and the Weather.—The average price of wheat, which in the three months April, May, June 1853, was at 44*s.* 6*d.* a quarter, was in 1854 at 78*s.* 4*d.*, and in the corresponding months of the present year at 73*s.* 4*d.* Bread has been dear for two years, or since the harvest of 1853. Beef is somewhat cheaper, and so are potatoes; while mutton is at the same price as in the spring quarter of 1854.

The weather during the quarter was remarkable for the continuance of the cold, which in the previous quarter had been unusually severe. Except on a few days only, the temperature was below the average. There was a deficiency of rain.

State of the Public Health.—The public health has partly recovered from the effects of the late epidemic cholera, and from the severe weather of last winter, and the mortality, which is on the average at the annual rate of 2·243 in 100 on the population, was 2·277 in 100 in the last quarter. The average rate of mortality in the spring quarter in 117 districts, comprising the chief towns, is 2·455 in 100 persons living, in the small towns and country parishes 2·056 in 100. The mortality in the last quarter was at the rate of 2·503 in 100 in the town districts, 2·097 in 100 in the country districts.

There were 106,493 deaths in the quarter; or 3907 more deaths than were recorded in the corresponding quarter of 1854; for the cholera, which was epidemic in that year, only became fatal in the subsequent quarter. In the Eleven Divisions the deaths varied little during the spring quarters of 1853, 1854, 1855.

In London some improvements are referred by the Registrar of St. Giles to the working of the Lodging House Act; and the health of Bermondsey has been better since the tidal ditches have been filled up, and the parish has been paved and drained.

In the South-eastern Counties, Farnham has for the last seven months been suffering from low fever, hooping-cough, and measles; Canterbury from small-pox, scarlatina, and bronchitis. Alverstoke has suffered severely from scarlatina, and the deaths (211) exceed the births (121): the same excess of deaths is observed at Winchester, where 23 men died in the barracks. The death of a female aged 105, at Windsor, is mentioned; and it is stated that her two sons are above 80 years of age.

In the South Midland Counties, Northampton and Bedford experienced a rate of mortality that much exceeds the average. Scarlatina has raged. In Royston the parish of Kelshall has suffered from typhus; the drainage and water are "very bad."

In the Eastern Division several districts have been healthier than usual; Norwich, Depwade, Mitford, Downham, and Thetford have, however, suffered from a higher than their average death-rate. Small-pox, measles, and scarlatina have prevailed in several districts of Essex and Norfolk.

In the South-western Division the mortality is about the average, but it was higher than it was in the preceding year in Wilts, Devon, Cornwall, and Somerset. The excess was considerable in Chippenham, Stoke Damerel, and Liskeard. The mining population in Cornwall is not in a satisfactory sanatory condition. One of the Registrars of Liskeard says:—

"In Calstock, one of the parishes of my district, there is an epidemic of scarlatina. Some houses of miners and others are overcrowded, and due regard is not paid to ventilation. There are no watercloseta, privies, or other conveniences belonging to the premises, and the places for the deposit of soil, &c. are in many places immediately adjoining the houses, in some almost touching the door of the dwellings. In another parish (Callington) there are several unregistered lodging houses, and the whole of them are in a filthy and unwholesome condition; every night there is a great influx of vagrants of the lowest order, and on my visiting them one night after 10 o'clock I found 5 persons in a bed, and as many as 18 in one room. It is a great pity the magistrates do not look into the matter and abate the nuisances."

In the West Midland Division, the mortality was lower in the spring quarter both in Staffordshire and Warwickshire than it was in the spring of 1854; measles, small-pox, and scarlatina are mentioned as prevailing in some districts of Shropshire.

The mortality in Lincolnshire, of the North Midland Division, was above, in Leicestershire, Nottinghamshire, and Derbyshire below, the death-rate of the previous spring quarter (1854). Scarlatina occurred in Lincoln,

Horncastle, Caistor, and Gainsborough. The frame-work knitting trade has been bad for some time in Basford, near Nottingham.

In the North-western Division, 2490 deaths were registered in Cheshire, 14,478 in Lancashire. A death from Asiatic cholera was returned at Runcorn on the 1st of June. Some sanatory improvements are noticed in the Lancashire towns. Liverpool is healthy at present. In West Derby it is said :—

"The district has been, during all the quarter, in a very healthy state, which may in a great degree be owing to the extent of street and house draining, street cleansing, and other excellent sanatory improvements that have been adopted by the corporation of Liverpool in the municipal part of the district."

At Wigan sanatory improvements are progressing, such as street sewerage, drainage of private property, and the removal of nuisances. The Registrar of North Bury writes :—

"The deaths in this quarter are considerably under the average, and amount to just a half the number of births. No small-pox, measles, scarlatina, hooping-cough, or cholera. The sewering, water supply, paving, scavenging, &c. of the town are in a very satisfactory state. Large sums have been judiciously expended by the town commissioners during the last seven years, to the comfort and advantage of the inhabitants, and the appearance of the town now offers an agreeable contrast to other manufacturing towns in this district."

These facts are encouraging, as they show that the high mortality in the Lancashire districts may be greatly diminished, and that substantial improvements are followed by immediate results. Measles, scarlatina, and typhus prevailed in some districts of Lancashire ; and the mortality was higher in Manchester than it was in the two previous springs.

In Yorkshire the deaths (10,423) were below the average numbers; and the decrease was chiefly in the West Riding. Leeds and Sheffield were healthier than in the previous two springs. The Registrar of Bradford East refers the low mortality to sanatory improvements ; vaccination is, however, neglected. He singularly enough observes :—"There is an "increase in the births this quarter, caused by a slight improvement in "trade, and the settling at home *of a great number of the wives of the "militia.*" The linen trade in Barnsley is depressed ; the colliery and iron works are carried on with vigour, and have drawn many families to the works ; the births and the deaths exceed the average numbers.

The Northern Counties experienced their average rate of mortality ; 5593 of the inhabitants died. Small-pox and scarlatina have been fatal in some districts of Durham ; vaccination is neglected.

In Monmouthshire and Wales the deaths were 7366, which is near the average number. Measles prevailed in Abergavenny and Crickhowell.

Third Quarter.—July, August, September.

The returns of deaths exhibit as their general result a favourable state of the health of the country in summer, and a striking improvement on the returns of the summer quarter of the previous year. The diminution of the number of marriages indicates some pressure on the resources of the people from the high price of bread ; but the low rate of mortality implies that under the English system of Poor Laws, imperfect as it is, the labouring classes suffer less distress than the workmen of the Continent, who have no legal right under any circumstances to relief. Liberality in the administration of the Poor Law is the natural remedy of many of the evils of high prices in England.

Marriages.—37,308 marriages were registered in the quarter, or less by 874 than the number in the corresponding quarter of the previous year, when the number of marriages was considerably above the average. The number of persons married was 74,616. The annual average rate of the summer quarter is 776 marriages to 100,000 of the population ; in the summer of 1854 it was 813, in the last summer 787. In Hampshire, chiefly in Portsea Island, the Isle of Wight, and Southampton, and in

some districts of Buckinghamshire, Bedfordshire, Northumberland, and Wales the marriages increased; in the mining and manufacturing districts the greatest decrease is observed, and notably in the mining districts of Cornwall, in Staffordshire (Wolverhampton and Dudley), in Cheshire, in Lancashire (Manchester, Bolton, and Liverpool), and in the West Riding of Yorkshire (Halifax and Leeds).

Births.—154,700 births were registered in the quarter that ended on September 30th. This number only exceeds by 24 the number of births in the summer quarter of the year 1854, and indicates a rate of birth (3·261) above the average of the season (3·146 annually). The births increased to some extent in the counties of Hertford, Northampton, Essex, Stafford, Worcester, Warwick, Leicester, Derby, Durham, and Northumberland.

Increase of Population.—154,700 births and 87,646 deaths were registered. The natural increase of the population of England and Wales in the three months is therefore 67,054, which makes the gain of people in nine months in this part of the empire 157,521. Of the number of immigrants from Scotland, Ireland, and foreign countries no record is kept. The emigrants from the ports of the United Kingdom at which there are Government Emigration Officers amounted to 44,698; of whom 13,486 were ascertained to be of English, 3534 of Scotch, 18,701 of Irish, 3093 of foreign origin; the origin of 5884 emigrants was not distinguished. After taking a due proportion of the latter class the English emigrants will amount to 15,530; nearly half of whom sailed to Australia, and the rest to our North American Colonies and the United States.

The number of emigrants from the United Kingdom, which was 109,236 in the summer quarter of 1852, has fallen to 44,698, which is nearly the same number as emigrated in the summer quarter of 1847.

The Prices of Provisions, and the Weather.—Among the most important circumstances that affect the numbers of births, deaths, and marriages, must be placed the state of trade, the prices of food, and the weather. The prices of consols in the three quarters that ended in September 1853, 1854, and 1855 were 97, 93⅞, and 90⅝; so the interest of money rose in the proportion of the reciprocals of these numbers. The prices of *wheat* in the same seasons were 51*s.* 10*d.*, 63*s.* 10*d.*, and 76*s.* 1*d.* a quarter; of *beef*, by the carcase, in the London markets, 5½*d.*, 5⅝*d.*, and 5⅞*d.* a pound. The prices of these articles of food therefore rose in the interval of two years, wheat 48 per cent., beef 15 per cent. Mutton, in the three summer quarters, was sold at 6⅛*d.*, 6*d.*, and 6*d.* a pound. Potatoes by the Waterside Market, Southwark, were sold at 117*s.* 6*d.*, 80*s.*, and 74*s.* a ton. The fall of 37 per cent. in the price of an article of food which is consumed at the tables of all classes, and by persons of all ages and both sexes, is an important set-off against the rise in the price of wheat, and may partly account for the fact that the public health is better,—the rate of mortality lower,—than it was in the summer of 1853.

The weather of the three months is described by Mr. Glaisher. The mean temperature was 60·4°, and was in every month slightly above the average at Greenwich. Rain which was in excess in July was below the average in August and in September. Since November 1853, 32¾ inches of rain have been collected about London, which is 14¼ inches or 30 per cent. less than the average. Wheat was cut at Ryde on July 14th, at Aberdeen on September 10th; so that the wheat harvest in the island extended over nearly two months.

State of the Public Health.—87,646 deaths were registered in the quarter that ended on the last day of September, and the annual rate of mortality in the quarter was 18·48 deaths to 1000 living, while the average rate of the summer quarter is 20·73. The annual rate of the summer quarter of the year 1854 was 24·23, and the number of deaths

were 113,843; the excess being due in a considerable measure to the epidemic of cholera and diarrhœa which broke out at Newcastle and other places in 1853, and was exceedingly fatal in London and several districts in the summer quarter of 1854.

In 117 districts comprising the chief towns 44,169 deaths were registered; while in the 511 districts comprising the small towns and the country parishes the deaths were 43,765; the annual rate of mortality was 1·643 in the latter districts, and 2·165 in the town districts, to every 100 of the population; or ·522 more in the towns than in the open country.

The health of the towns exhibits some improvement, for the mortality to 100 living has fallen from 2·633 in the ten summer quarters (1845–54), to 2·165 in the summer quarter of 1855; but the great incentive to exertion remains, that the mortality is certainly not inevitably at a higher rate than 1·643 in the summer quarter, as that rate only was actually experienced on the area of 511 districts.

The great work of the day is to improve the health of the people; and the first steps towards its accomplishment are the throwing open building grounds on favourable sites, facilitating the distribution of the population over town and country by railways, supplying the towns with pure water, draining and opening streets, and removing constantly for immediate deposit in the soil the town guano, which would no doubt prove an excellent substitute for the guano that is now fetched from the islands of a foreign state in the Pacific Ocean by British ships, which could in former ages only be allured round Cape Horn by silver and gold.

The health of London is described in the weekly tables. The deaths were 13,069 in the quarter, or less by nearly *twelve thousand* than the deaths in the corresponding quarter of last year, when cholera was epidemic, and less by 110 than the deaths in the corresponding quarter of 1853. The Belgrave sub-district, which lies low and is still supplied with the impure water of the Thames, suffered, the Registrar states, from low continued or gastric fever.

The mortality has before in England as in other countries been low after an epidemic, and it has been hence inferred that epidemics only carry off prematurely people who would otherwise die in the course of a few years. But it will be observed that in every Division, although cholera was not generally epidemic, the mortality is lower than it was in 1854.

The deaths in the South Eastern Division were 7482, or less by 2060 than in the corresponding quarter of 1854. At Gillingham dysentery and diarrhœa prevailed, the deaths of some invalids from the Crimea and the Baltic were registered. The cholera seeds still remain about Sandgate, where 5 persons died from the disease, besides 2 in the town of Folkstone, and 34 men of the foreign legion, who were stationed in the Folkstone district.

In the South Midland Counties 5758 persons died; or less by 1116 than died in the summer quarter of the previous year. Scarlatina has prevailed in Bedford, and the Registrar remarks that "the great majority of deaths from this and other zymotic diseases have occurred in the worst drained and most densely populated localities."

In the Eastern Counties,—Essex, Suffolk, and Norfolk,—the mortality fell to nearly the same extent, and was at a lower rate than it was in 1853. A river bargeman died of cholera in West Ham; he was brought from Poplar in London. Two men were brought ashore, and died of "malignant cholera" at Lowestoft.

In the South Western Counties, where the mortality was not raised above the average of the season by cholera in 1854, the mortality was below the average in 1855; thus implying a favourable sanitary constitution of the season quite independently of any previous removal of weakly people by epidemic cholera. The Registrar of Redruth says:—"People are now *beginning to think* that cleanliness and the removal of

nuisances from near their houses are conducive to health;" and he notices that the "deaths are much below the average." The removal of the "muck" to some distance from the farm-houses and cottages would not only be conducive to the health of the farmers and labourers' families, but lessen the mortality of every kind of stock.

The West Midland Counties exhibit a low rate of mortality (9692 deaths); Birmingham has lost some lives from diarrhœa, but has been on the whole unusually healthy.

In the North Midland Counties the deaths are low in numbers (5286) when compared with the deaths of previous years.

14,905 deaths were registered in Cheshire and Lancashire, against 17,225 deaths which occurred in the summer quarter of last year. Diarrhœa was becoming prevalent in Chester; and one death from cholera was registered. Liverpool and Manchester exhibit signs of increased salubrity.

In Yorkshire the deaths were 9177, against 10,829 in the corresponding quarter of 1854; Leeds and Hull were healthier than usual.

The Northern Counties lost 4998 lives, against 7058 in 1853 and 5907 in 1854. The great outbreak of cholera in Newcastle-upon-Tyne raised the mortality in that town to 2085 in the summer quarter of 1853, against 531 in the summer quarter of the present year.

The deaths in Monmouthshire and Wales were 5242, and the mortality was less than in either of the summer quarters of the two previous years.

The decrease of the mortality in some districts is striking, and the registrars in their notes endeavour to account for this evident fact. Some refer the improved health of the people to the fine weather; others to active employment in the harvest; others to the removal of the population, either in search of employment, or by drafting into the militia, and into the ranks of the army. In the mining district of Redruth the Registrar conceives that "the frugality and temperance" promoted by the high price of provisions has been salutary; in other districts the benefits of improved health are connected with "good wages and plentiful work;" in many places the utility of sanatory measures is admitted. The Registrar of Pontespury, who has registered no death for two months, "can assign no cause." One registrar makes the following statement:—

"The deaths are below the average. In the township of Workington, containing a population of 6122, the deaths during the last 9 years have averaged 42 quarterly; this quarter they are 21. In the other 9 townships, containing a population of 3412, there have been only 4 deaths. Some ascribe the decreased mortality to Providence; others to improved sanatory arrangements."

Various causes in operation undoubtedly contributed to this happy result:—that if all the deaths of British soldiers in the Crimea during the last three months were added to the deaths in England the sum would be less by some twenty thousand than the deaths registered in England during the three summer months of 1854. More lives may be saved by sanatory arrangements at home every year than have ever perished abroad in the years of our greatest losses in war; and the enlightened people of this kingdom will suffer no such embarrassment as the Registrar of Workington has recorded if this result be realized, as they know that all effectual measures for the improvement of the human race receive the blessing, because they are the inspirations, of Divine Providence.

Fourth Quarter.—October, November, December.

The return is on the whole satisfactory. But the marriages were slightly below the average of recent years, from various causes. The births were near the usual number; and the mortality was much below the average, both in the towns and in the country.

Marriages.—47,070 marriages were celebrated, and consequently 94,140 persons were married in the three months that ended on 31st December 1855. The number of marriages in the first quarter of the year was *29,186, in the last quarter* 47,070; but it has always hitherto happened

in England that the marriages are most numerous in the Christmas quarter after harvest, and least numerous in the Lent quarter, so that this difference is in accordance with the ordinary state of things. The rate of marriage in the last quarter of the year was much below the rates of marriage in the corresponding quarters of the years immediately preceding. The rate of marriage decreased in London and in the manufacturing districts, and the decrease is probably referable partly to the high price of provisions, and partly to the increase of the army and navy, where men do not marry to the same extent as in the civil population.

Births.—148,841 births were registered in the last quarter of the year 1855; or more in number by 2402 than the births in the corresponding quarter of 1854. The annual rate of births in the quarter was 3·128 per cent. on the population; which is near the average (3·112). There was an increase of births in every division, except in the two divisions south of the Thames and in the Eastern Counties. The Registrars account in various ways for the decrease of births. At Royston the Registrar says:—"Many young married men are gone into the militia." The militia is referred to also by the Registrar of Hatfield; and at St. Albans "the removal of many young women with the numerous recruits," accounts for the decrease of births. Upon the other hand, "the formation of the camp at Aldershot" it is said "accounts for the increase of births and deaths" in the district of Farnham. The registrar of Southampton notices that only 84 births took place in May, while the numbers in that month in previous years had varied from 95 to 142; and on the whole he has a decrease in the year of 138 births; which he attributes "to the fact that so many ships belonging to this port have been detained in the Black Sea, rather than to a diminution of the population." The decrease of births in Camborne, Redruth, is explained by "the fact that a very large proportion of the male population has been for some time past employed in America at the copper mines of the Lake District, and the gold diggings of California and Australia, where a great number of Cornish miners have emigrated, leaving their wives and families at home, who are maintained by remittances from the husbands."

Increase of Population.—In the Northern and Midland Counties the effects of temporary or local causes of the decrease of births in the South have been neutralized; and generally in England there is little ground of complaint or of any apprehension of a paucity of births, as 635,043 children were born in the year of war 1855; or 209,340 in excess of the number of deaths (425,703). In the last quarter of the year the excess of births over deaths, or the natural increase, was 51,819. Of the immigration into England and Wales from Ireland and Scotland during the period no records exist.

24,207 emigrants sailed from the ports of the United Kingdom at which there are Government Emigration officers; 16,111 to the United States, and 7329 to the Australian colonies. 7615 were ascertained to be of English origin, 840 Scotch, 10,689 Irish, and 1426 foreigners; the origin of 3637 was undistinguished.

The Prices of Provisions, and the Weather.—Upon comparing in the table the prices of the principal articles of food in the last quarters of the years 1853, 1854, 1855, it is seen that wheat was 69*s.* 10*d.*, 68*s.*, and 79*s.* 4*d.* a quarter; beef was 5*d.*, 5⅝*d.*, and 5⅝*d.* a pound. Mutton 5⅜*d.*, 6*d.*, and 5¾*d.* a pound. Bread was dear during the last quarter. The average prices of beef and mutton by the carcase were equal, differing little from the prices of 1854, but higher than the prices of 1853. Potatoes have fallen from 150*s.* a ton in 1853, to 95*s.*, and this materially alleviates the pressure from the high prices of other articles. The mean temperature of October was above, of November and December below, the averages of *those months. The air* was humid in October and No-

vember, dry in December. The average quantity of rain fell at Greenwich. The mean temperature varied from 46°·5 in Cornwall and Devon to 41°·7 in North Shields; the fall of rain, from 10·5 in. in Newport and Ryde to 5·5 in. in Liverpool.

The deaths of 97,022 persons were registered in the last quarter of the year; and the annual rate of mortality was 2·039 per cent. on the population, or 0·130 less than the average rate of the season (2·169).

The mortality of 117 districts, comprising the chief towns of England and Wales, was in the quarter at the rate of nearly 24 in 1000; the mortality in the other 511 districts containing the small towns and the country parishes was at the rate of 18 in 1000; the average rates of the ten autumn quarters preceding, were nearly 26 in 1000 in the large town districts, and 20 in the small town and the country districts.

The mortality was slightly below the average in each of the South-eastern Counties; Croydon and Dartford, which formerly suffered from epidemics, were healthy. Canterbury, Gravesend, and Farnham have suffered to some extent from epidemics. Small-pox prevailed among the soldiers at Canterbury, who it appears had not been vaccinated. Scarlatina prevailed in Alverstoke, Newport (Isle of Wight), Winchester and Windsor. At Winchester there have been *seven* deaths "from *fever;*" and, adds the Registrar, "about the same number of deaths from syphilitic gangrene or *ulcus grave*, which prevailed in the military hospital, and also in the county hospital and union workhouse, especially among women."

The mortality is much lower than it was last year in the South Midland Counties. In a few districts epidemics prevailed. Small-pox has been fatal in Ware, in the "densely populated courts and alleys," where vaccination was neglected. The Registrar of Royston notes:—"Sanatory arrangements much neglected, typhus very prevalent." Scarlatina was fatal in Welwyn, Harpenden (Hertford), Chesham (Bucks), Turvey, Bedford and Cardington, Ivinghoe (Beds), in Cambridge, Ely, and Wisbeach. Small-pox occasioned some deaths in these counties. Many complaints are made of the working of the Vaccination Act. Scarlatina and fever prevailed in Cambridge both during summer and autumn.

The mortality was low in the districts of the Eastern Counties, with the exception of Risbridge, King's Lynn, Saffron Waldon, and a few more. Scarlatina in a malignant form was prevalent in the parish of Downham and in the Ingatestone sub-district. Erysipelas, chiefly of the face, was very prevalent in Coggeshall. The Registrar of Manningtree

TABLE XVII.—ENGLAND. MARRIAGES, BIRTHS, and DEATHS in each Quarter of the Years 1838–1855.

YEARS.	MARRIAGES. In the Quarters ending the last day of				BIRTHS. In the Quarters ending the last day of				DEATHS. In the Quarters ending the last day of

says:—"Several fatal cases of typhus and scarlatina have occurred in the parish of Ramsey, which is situate a few miles from Harwich. I consider Ramsey to be the most unhealthy parish in this district. There is a large tract of marsh land surrounding the village, and, as far as I can learn, a great want of drainage exists. Some sanatory measures ought to be at once put in motion, otherwise the inhabitants must continue to suffer from a disease, which is so prevalent in almost every cottager's residence in the parish." At Sudbury only 54 deaths occurred in six months out of about 8000 people. The population are fully employed. The improvement in the health of Rattlesden (Stow district) is ascribed to "sanatory regulations."

In the South Western Counties the deaths (8342) were below the average. Scarlatina was, however, fatal in several districts; so was fever. In St. Keverne, in Cornwall, the excess of deaths (121 to 29 births) was the consequence of the wreck of the barque "John" on the Manacles, when the bodies of 93 emigrants were cast on shore. The diminished mortality of Edington (Westbury) is referred to the works of the sanatory inspector. The poor of Heavitree, near Exeter, suffer much from the high price of food; but soup kitchens afford some relief.

The West Midland Counties (Gloucester, Hereford, Salop, Stafford, Worcester, and Warwick) experienced a rate of mortality much below their average. The deaths were 12,594 in 1853, 13,587 in 1854, and 11,169 in 1855. The decrease is most striking in the great towns; thus, in the last quarters of 1853 and 1855 the deaths in Bristol and Clifton were 904 and 726, in Wolverhampton 858 and 694, in Dudley 1032 and 747, in Birmingham and Aston 1888 and 1440. In Coventry the deaths showed little decrease. Of the 93 deaths in the Holy Trinity sub-district "54 are those of children under 3 years old, the causes of death being generally either 'natural weakness,' 'diarrhœa,' or 'convulsions.'"

The deaths (5678), except in Rutland, were below the average in the North Midland Counties; namely, in Leicester, Lincoln, Nottingham, and Derby.

In Cheshire and Lancashire the improvement is less extensive than it is in other counties. The deaths were 16,926. The deaths in Liverpool

---

TABLE XVIII.—ENGLAND. ANNUAL RATE per Cent. of MARRIAGE, BIRTH, and DEATH, during each Quarter of the Years 1838–1855.

1855 -	·633	·824	·787	·989	3·603	3·534	3·261	3·128	2·916	2·277	1·848	2·030
Mean -	·682	·831	·776	·971	3·341	3·414	3·146	3·112	2·507	2·243	2·073	2·169

The Table may be read thus, without reference to the decimal points:—In the March quarter of the year 1838, to 100,000 of the population of England there were 618 marriages, 3,032 births, and 2,615 deaths registered. The three months January, February, March contain 90, in Leap year 91 days; the three months April, May, June, 91 days; each of the two last quarters of the year 92 days. For this inequality a correction has been made in the calculation.

and West Derby, where scarlatina was epidemic, were 3487, or 273 more than in the last quarter of 1853. The deaths in Manchester and Salford, on the other hand, were 2396, or 371 less than in 1853. Many deaths from scarlatina occurred in Runcorn. In Knott Lane, Ashton, several deaths occurred among persons who were attended by an unqualified practitioner.

The decrease in the mortality of Yorkshire is considerable; the deaths in the last three months of 1853 were 10,670, in the last three months of the year 1855 they were 9361. Bradford, Leeds, Sheffield, York, and Hull exhibit a great diminution in the number of deaths.

The deaths in the Northern Counties, Durham, Northumberland, Cumberland, and Westmorland, were 5499, and below the average. Scarlatina has been very fatal. It prevailed with much severity in the colliery districts of Durham. The two villages in Easington, in which it was most fatal, are situated very low, on a marshy, damp, badly-drained soil. In South Shields district, where many men are employed on the construction of an extensive dock, scarlatina and typhus have prevailed. At Bedlington, Morpeth, small-pox has been raging among all classes, affecting both young and old. Those who had not been vaccinated were great sufferers. 14 persons died of Asiatic cholera, 7 of diarrhœa, in Sunderland East—the seat of the first outbreak in 1831.

In Monmouthshire and Wales 5833 persons died. Scarlatina and typhus attacked some districts; but the mortality was less than in the two previous years.

Upon the whole, the health of England and Wales exhibits evidences of improvement.

GREAT BRITAIN.

The annual report of the Registrar-General for Scotland now supplies us with the births, deaths, and marriages of that portion of the United Kingdom; and in Table XXII. the rates of marriage, birth, and death in Great Britain are given for the first time. It will be seen that they are all lower than the corresponding rates in England; but as Scotland contains about *one-seventh* part of the population of Great Britain, its numbers only go to that extent into the general results.

The returns of Ireland are still required, to enable us to compare the marriages, births, and deaths of the United Kingdom, with the returns of France and of the other great states of Europe; which, although they are not called *United Kingdoms*, embody the statistics of all their old provinces in their annual reports.*

Ireland is not the least important, nor the least interesting part of the United Kingdom in the present day; and it is much to be desired that the Registrar-General of Ireland should be enabled, by an extension of the Irish Registration Act to secure the registration of all the births, deaths, and marriages, and thus complete the annual population statistics of the United Kingdom. Ireland in this respect is alone in Europe; it is the only

* According to an estimate, necessarily loose, by the Irish Census Commissioners, the rate of birth was 3·226, of death 2·222 per cent. in Ireland. The rates for the United Kingdom were, *therefore, births 3·317, deaths 2·234* per cent. in the year 1855.

civilized country which is without a system of registration of births, deaths, and marriages.

ENGLAND AND FRANCE.

I have thought it might be interesting at the present time to compare the returns of France and the returns of England with the view of exhibiting the relative condition of the populations of the two countries.

The lucid annual report of M. Legoyt for the year 1853 has just appeared; and I have selected, for the purposes of comparison with England, the corresponding figures for that year, relating to education, marriage, birth, and mortality in France.

There can be no doubt that the analysis of the relative numbers that sign the marriage registers with marks and that write their names in the national returns, throws more light on the permanent results of elementary education than any other test that has yet been devised. That view of the matter is now taken by foreign statists; and this interesting item appears for the first time in the French returns.

It is a remarkable fact that, exclusive of the metropolitan cities, in England and France nearly the same proportion, 34 in every 100 of the men who marry, do *not write* their names in *signing the marriage register;* the exact proportion of the ignorant men in France is 33·70, in England it is rather more, or 33·93 in 100. The French women are even less

TABLE XXII.—ESTIMATED POPULATION, MARRIAGES, BIRTHS, and DEATHS in Great Britain, 1855.

versed in writing than English women; for of *French women* 55 in 100 *did not write* their names, of English women 48 *did not write* their names, but made their marks. Both the proportions are deplorably high, and show how much has to be done to convey the first rudiments of instruction to the great body of the people in two of the most enlightened nations of the world.

As the returns for France, through some accident, do not include the facts for Paris in the department of the Seine, I have excluded the marriages in London from the English returns, as in the capitals the numbers who can write are disproportionately great.

The ages of the French population are distinguished for the first time in the census of 1851; and from the census and the other report, Table (A.) has been compiled, showing the estimated population and the deaths at various ages in the year 1853. (*See* Appendix, p. 188.)

I subjoin a Table (XXIV.) in which the mortality of the population of the two countries is shown in juxta-position. It will be observed that the mortality of France is rather less than the mortality of England in this year; but that the rate of mortality bears differently on different periods of life in the two countries.

Another Table (XXV.) is inserted, which was constructed from the estimated population, and from the deaths at different ages in the ten years 1840–49 as given in the *Annuaire de l'Economie Politique.* In this Table the mortality of France is higher than the mortality of England and Wales; but at certain ages, in the middle periods of life, the mortality of the English people considerably exceeds the mortality of the French. This is due, it is believed, to the bad sanitary condition of all the English towns in the years 1840–49, and especially to the *greater proportion of town population in England.* For the same reason the mortality of England and Wales is greater than the mortality of Scotland, and also greater than the mortality of Ireland, as estimated by the Irish Census Commissioners.

In years of scarcity, however, the population of France suffers more from privation than the population of England. France has no system of insurance against death by starvation extending over the whole population, such as is now imperfectly provided in England, Scotland, and Ireland by the Poor Laws; and the failures of crops fall heavily upon the small proprietors, who can draw the means of living from no other source than their small parcels of land.

The water supply in the French towns is bad, and their cesspool system is abominable; hence they suffered severely from cholera in 1854.

TABLE XXIV.—1853. ENGLAND and FRANCE.—Annual RATE of MORTALITY per Cent. of Males and Females at different Ages.

AGES.	Annual Rate of Mortality per Cent.			
	Males.		Females.	
	England and Wales.	France.	England and Wales.	France.

95 and upwards	47·305	38·422	45·770	35·966

The mortality of the population of France in 1854 was 2·746 per cent., while the mortality of the population of England in the same year was 2·352 per cent. The deaths in France exceeded the births by 69,318. The deaths by cholera are estimated at 150,000; the deaths by the scarcity, which began in 1852, was sensibly felt in 1853, and prevailed with much intensity in 1854, M. Legoyt sets down at 60,000.

Under the 96th article of the Code Napoleon, information of the death of every French soldier who dies out of France should be sent home by the regimental authorities, and entered on the civil registers of his last known place of residence in France. This law had been laxly executed until the last war, when upon a representation made to the War Minister at its commencement he replied: *qu'il allait prendre les dispositions nécessaires pour que tous les décès militaires fussent inscrits, autant que possible, au dernier domicile connu en France.* Under these regulations about 20,000 deaths of French soldiers and sailors were registered.

The present arrangements for the *civil registration* of the deaths of soldiers and seamen in foreign parts are unsatisfactory both in France and in England. The deaths of French soldiers abroad are improperly confounded with the deaths in France; whereas they should appear in the general register under a separate heading, and be compared with the strength of the army abroad; at the same time the aggregate deaths should be taken into account, and set off against the aggregate births.

In England the deaths of soldiers abroad are never inscribed upon the civil registers; and I have no means of ascertaining either the actual mortality or the causes of death of the whole of the English population, including the army and navy, until some permanent arrangement be made by the Legislature. I wrote to the Secretary of State for War in 1854, calling his attention to the subject. In 1855 I addressed the Secretary for War in a second letter, which is, with a few omissions, subjoined, as it shows the present unsatisfactory state of the question.*

* Copy of a Letter from the REGISTRAR GENERAL to LORD PANMURE.

General Register Office,
February 10th, 1855.

My Lord,

The 26th Section of 6 & 7 Will. 4. c. 86. provides for the registration of the deaths of British Seamen; but no provision is made for recording, in this department, the deaths which occur in the British army abroad.

I am aware that, upon inquiry at the War Office, relations may obtain information as to the last returns received respecting soldiers; but the enclosed Form shows that few facilities are given to the public in making these inquiries, and that precautions are

I cannot now state, as the French civil department does, the numbers of deaths in the army and navy. But if we compare the mortality of the female population of the two countries, France lost 2·721 per cent., England 2·273 per cent. of the female population at home in the year 1854.

Fecundity of the French population.—The temporary decrease of the population of France has naturally attracted attention, as it has occurred for the first time, M. Legoyt states, in the *last fifty-four years.* In considering its causes, the diminishing number of births, to which I have before adverted in my Reports, has attracted attention, and given rise to

---

TABLE XXVI.—1853–54. ENGLAND and FRANCE. ESTIMATED POPULATION, MARRIAGES, BIRTHS, and DEATHS, in each of the Years 1853–54.

	Estimated Population.		Marriages.		Births.		Deaths.	
	1853	1854	1853	1854	1853	1854	1853	1854
England and Wales -	18,403,313	18,518,760	164,520	159,727	612,391	634,405	421,097	437,905
France - - - - -	36,225,000	36,155,682	280,000	270,000	936,967	923,461	705,607	992,779

The Population of England and Wales for 1853 and 1854 has been deduced by taking the excess of births over deaths since 1851, when the population was enumerated. The Population of France for 1853 is obtained from the "Statistique de la France, deuxième série. Tome III. (1re partie)," and for 1854 by making a deduction for the decrease of births as compared with deaths in that year.

1853–54.—PROPORTION of MARRIAGES, BIRTHS, and DEATHS to the Population of England and France.

	To 100 Persons living.							
	Marriages.		Persons Married.		Births.		Deaths.	
	1853	1854	1853	1854	1853	1854	1853	1854
England and Wales -	·894	·858	1·788	1·716	3·328	3·407	2·288	2·352
France - - - - -	·775	·749	1·550	1·498	2·587	2·554	2·196	2·746

The rate of mortality of females during the year 1853 was, in England 2·201, and in France 2·189 per cent. In 1854 the female rate of mortality in England was 2·273, and in France 2·721 per cent.

---

considered necessary to prevent unnecessary queries, and to limit the investigation to the nearest relatives or representatives of the party.

It appears to me very desirable that in this central office which contains the record of 20,000,000 deaths, marriages, and births, which have occurred in England and Wales since 1836, a record should also be kept of the deaths of all soldiers who die abroad.

I am aware that it is far from desirable to make any addition to the numerous periodical returns made by all officers commanding regiments, and I am also aware of the difficulties in time of war of obtaining the exact information as to the date and cause of death, when so many die on board transports and in distant hospitals; but I submit to your Lordship that these difficulties may be easily surmounted, and that it will be a great boon to the public if arrangements can be made that I be furnished, as soon as possible, with a nominal return from each regiment in Her Majesty's service of every soldier whose death has taken place in 1854; arrangements being at the same time made that similar information should be sent to me in future at such periods as may be considered best, either monthly, quarterly, or yearly.

Here the names would be indexed alphabetically, and information at once be afforded to the public.

I take the liberty of enclosing a Form which might be used, but if your Lordship is disposed to entertain the application which I thus venture to make to you, the authorities under your Lordship's direction will probably be able to prepare a better description of Form.

I have, &c.,
(Signed) GEORGE GRAHAM,
Registrar General.

After a lapse of six months, the Registrar-General was officially informed (Aug. 10th 1855) that Lord Panmure, after considering the subject, found that the proposal would impose much trouble in the Offices at home, and upon Commanding Officers abroad, and was "of opinion that for the present the consideration of the question had better be postponed."

controversy. It is, undoubtedly, a remarkable fact that, while the births in England go on rapidly increasing, the births of French children are not increasing, but are actually decreasing. 981,614 children were annually born (alive) in France on an average in the five years 1824–8, and 957,894 annually on an average in the years 1850–4.* In 1854 the births were 923,461 out of a population of 36,155,682 in France, and 634,405 out of 18,618,760 in England and Wales.

Thus in France to 1000 of the population 26 children were born; in England and Wales the same population gave birth to 34 children in the year 1854.

A great portion of this difference is not referable to unusual abstinence from marriage in France, as some speculators have supposed, but to the difference in the fecundity of the married women at puerperal ages in the two countries. This is shown in the annexed Table (XXVII.)

The causes of death in England and Wales in the year 1855 are discussed by Dr. Farr in a letter addressed to me, which will be found in the Appendix (p. 179).

I have the honour to be,
Sir,
Your faithful servant,
GEORGE GRAHAM,
Registrar-General.

TABLE XXVII.—ENGLAND AND FRANCE. 1849–53.—Number of WIVES; and SPINSTERS and WIDOWS enumerated in 1851; the Number of BIRTHS IN WEDLOCK and OUT OF WEDLOCK registered in the Five Years 1849–53; and the Average Annual Proportion of Births in Wedlock to Wives, and Births out of Wedlock to Spinsters and Widows.

	Enumerated in 1851.				Births registered in the Five Years 1849–53.		Average Annual Proportion of Births *in Wedlock* to 100 Wives of the Ages		Average Annual Proportion of Births *out of Wedlock* to 100 Spinsters and Widows of the Ages	
	Wives of the Ages		Spinsters and Widows of the Ages							
	15–40	15–55	20–40	15–55	In Wedlock	Out of Wedlock	15–40	15–55	20–40	15–55
England and Wales	1,630,456	2,553,894	1,348,182	2,449,669	2,819,964	206,885	34·591	22·084	3·267	1·685
France – –	3,252,746	5,808,781	2,382,234	4,779,896	4,491,269	349,123	27·615	16·029	2·930	1·461

The Mothers of all the children born are included in the Women of the ages 15–55, and a large proportion—about seven-eighths—of the mothers, are 15 and under 40 years of age. Hence the number of children born alive has been divided by the numbers of women of those ages.

The last four columns of the Table may be read thus:—To every 100 WIVES in England and Wales of 15 and under 40 years of age the proportional number of all children born alive annually was nearly 35, in France nearly 28; or every 100 wives of the ages 15–55 gave birth to 22 children in England and Wales, and to only 16 in France. To every 100 SPINSTERS AND WIDOWS of the age 20–40 there were 3·267 children born alive *out of Wedlock* in England and Wales, and 2·930 in France.

* The Districts are collections of contiguous Parishes or Places, for the purposes connected with the Registration of Births, Deaths, and Marriages; and are generally identical with the Poor Law Unions of the same names. The Districts are arranged according to their local position under the Registration Counties.

AGES OF BACHELORS.

* In the other cases the column of the Register headed "Age" is filled in by the Officiating Minister with the words "of full Age," "Minor," "Under Age," as the case may be; thus losing the additional means of identification afforded by a precise statement of the age of persons at the time of marriage.

Ages of 3,741 Bachelors and 3,741 Widows who intermarried in 1855.

* The *Registration Counties* consist of groups of entire Registration Districts; which Districts are, in general, identical with the Unions. As the principle adopted has been to place a District or Union which extends into more than one County with the County either the principal town or the greater part of the population is located, the limits of the Registration Counties differ more or less *boundaries of the Counties proper.*

† *Some of the births—especially of illegitimate* children in London and large towns—escape registration.

MARRIAGES, BIRTHS, and DEATHS registered in the Year 1855—*continued.*

* The *Districts* are collections of contiguous Parishes or Places combined for purposes connected with the Registration of Births, Deaths, and Marriages; and are generally identical with the Poor Law Unions of the same names. The Districts, 625 in number are arranged according to their local position under the Registration Counties.

† For a table of the Deaths in the principal *Public Institutions* situated in the Districts of London *see* pages 83-4.

Note.—Wherever the minus sign is prefixed to the number in the column headed "Excess of Births over Deaths," it denotes that the Births in the District, instead of exceeding the Deaths were, in fact, *less than the Deaths* to the extent stated.

II.—SOUTH EASTERN COUNTIES.—MARRIAGES, BIRTHS, AND DEATHS, 1855—DISTRICTS—*continued.*

No.	DISTRICTS.	Area in Statute Acres.	Population, 1851.	TOTAL MARRIAGES.	TOTAL BIRTHS.	TOTAL DEATHS.	Births. Including Illegitimate Births. Males.	Births. Including Illegitimate Births. Females.	Illegitimate Births. Males.	Illegitimate Births. Females.	Deaths. Males.	Deaths. Females.	Excess of Births over Deaths.

NOTE.—The Sub-districts are sub-divisions of the Districts, and comprise the Parishes or Places in which the Births and Deaths are registered by Registrars severally appointed for that purpose.

The letter *W* denotes that the Sub-district contains within its limits a Workhouse belonging to the District or Union; *w* indicates that a Workhouse belonging to *another* District or Union is included.

Wherever the minus sign (−) is prefixed to the numbers given in the Column headed "Excess of Births over Deaths," it denotes that the Births in the Sub-district, instead of exceeding the Deaths, were, in fact, *less than the Deaths* to the extent stated.

The Excess of Deaths over Births in several of the Sub-districts of London is attributable to the mortality in Hospitals.

For the number of Deaths in the Hospitals, Workhouses, and other principal Public Institutions in London, see pp. 83-4.

ENGLAND AND WALES.—SUPPLEMENTARY TABLE

[The principles upon which the Causes of Death are tabled have been explained in pr
Annual Reports. It will be sufficient to state now that all the Diseases, either having a d
character, or fatal to any considerable number of persons, are classified under 107 l
some of which, however, include groups of very distinct diseases,—such as are fatal to
few persons, or *diseases* which are often confounded with other diseases. The rule has l
refer the distinct diseases to heads under which the cases were so numerous, that the add
numbers would not interfere with the calculated proportions. Thus *mumps* was the ca
93 deaths (Males and Females) in the year 1855, and scarlatina of 17,221. The mort

(continued at page 146.)

Causes of Death at different Periods of Life, in the Year 1855.

scarlatina, deduced by dividing the deaths from that disease, *plus* 93, by the total population of England, will be found to differ little from the mortality from scarlatina alone. Where it is desired, partial correction however can now be made by means of the following Supplementary Tables, containing many of the deaths from distinct diseases, such as mumps, glanders, epistaxis, piles, dry gangrene, polypus, rickets, bronchocele, &c. &c., and deaths from other forms of disease, such as softening of the brain (necrencephalus), which are returned in many cases under other heads, as paralysis, &c.

These Tables are an extension of the Tables of Causes of Death in England, pp. 120–123.]

particularly in young children and old people. It will be observed that in the two years the deaths from diarrhœa fell from 20,052 to 12,770; while the deaths from cholera fell from 20,097 to 837. The severe convulsive form of the epidemic almost disappeared.

Influenza grew more fatal. 3568 deaths are referred to this catarrhal affection, which in no year since 1848 had been so fatal. And undoubtedly many of the deaths registered under bronchitis and pneumonia belong properly to influenza.

Typhus was fatal in 16,032 instances. The mortality under this head, including all the forms of common continued fever, was below the average.

TABLE (1).—Causes of Death registered in England in each of the Eight Years 1848—1855—*continued.*

	Causes of Death.	1848	1849	1850	1851	1852	1853	1854	1855

Metria and erysipelas were more fatal than they were in the four previous years. Rheumatic fever terminated fatally in 1046 cases.

Fourteen persons died of hydrophobia in England.

(2.) *Constitutional Diseases: Cachectici.*

The deaths by causes under this head amount to 87,787. The deaths are 21 per cent. of the total deaths, and these diseases destroyed in the year 47 out of every 10,000 of the population.

TABLE (2).—ENGLAND. CAUSES OF DEATH. To 1,000,000 PERSONS LIVING, the DEATHS from each Class of Causes, and from each Cause, in the Years 1853, 1854, and 1855.

	CAUSES OF DEATH.	Deaths to 1,000,000 *Persons living.* 1853	1854	1855

y eight causes. 77 in every 100 deaths are classed under the first
ads in this Table. Hydrophobia and disease of the pancreas
ıses of the fewest deaths.
ɔility to diseases at the various periods of life possesses great
nterest to the pathologist in the study of morbid changes, and to
ian who seeks to ward off their inroads.
bles (pp. 120—142) present a mass of information on this
subject, such as has never before been published in any country.
have been subjected to various calculations, I hope to be able
nder your notice some of their interesting results.

I have the honour to be,
Sir,
Your obedient and humble servant,

trar General. WILLIAM FARR.

-ENGLAND. CAUSES OF DEATH in the Year 1855, arranged in the order of Mortality.

The Population at each age, as given in the "Statistique de la France, deuxième série, tome II. pp. 260–1," has here been corrected for *increase*, on the assumption that the increase has been uniform at every age, and that the same rate of increase has taken place *since* 1851 as was observed between 1846 and 1851. The Deaths are taken from the "Statistique de la France, deuxième série, tome III. (1re partie), pp. 31–39." A correction has been made both in Population and Deaths for Ages not stated. Those numbers have been distributed over the numbers against the various ages. According to M. *Legoyt*, some of the young under 5 years of age escaped enumeration.

[The following Index furnishes a reference to the *Number* of each DISTRICT in the topographical arrangement adopted in the Tables of Abstracts contained in the Report, the numbers running consecutively from 1 to 623.* In forming the alphabetical arrangement the principle is adopted of placing compound names in the order in which they are pronounced: thus, East Ashford will be found under the letter E, and not under A, as Ashford, East.]

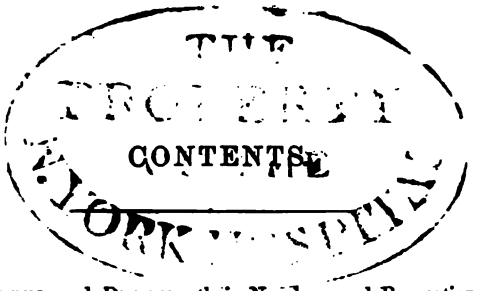
1858.



CONTENTS.

PAGE

REPORT:—

MARRIAGES, BIRTHS, and DEATHS; their Numbers and Proportions to the Population, also the EMIGRATION during the Year 1856 . . i–iii

MARRIAGES in 1856. Number celebrated according and *not* according to the Rites of the Established Church; after Licence, Banns, &c.; effect of prices of food on the Marriages . . . . . iii–v

Marriages of minors . . . . . v–vii

Re-marriages vii

Signatures of Persons married . . . . . vii–ix

BUILDINGS registered for the SOLEMNIZATION of MARRIAGES . viii–ix

BIRTHS in 1856. Number and Proportion of Births of each Sex, *in* and *out of* Wedlock; also in each Quarter of the Year . . . ix–xiii

DEATHS in 1856. Mortality of Males and Females at different Ages, Seasons, and Localities . . . . . xiii–xvii

SUMMARY of the QUARTERLY REPORTS, 1856:—

FIRST QUARTER, ending March 31st . . . . xvii–xx

SECOND QUARTER, ending June 30th . . . . xx–xxiv

THIRD QUARTER, ending September 30th . . . xxiv–xxvii

FOURTH QUARTER, ending December 31st . . . xxviii–xxxv

TABLES . . . . . xxviii–xxxiv

MARRIAGES, BIRTHS, and DEATHS in GREAT BRITAIN . . xxxv–xxxvi

MORTALITY of GREAT BRITAIN, including the ARMY ABROAD . xxxvi–xxxvii

MARRIAGES, BIRTHS, DEATHS in ENGLAND and FRANCE . . xxxvii–xxxviii

BIRTHS and DEATHS of ENGLISH SUBJECTS at SEA . . . xxxviii–xxxix

CERTIFIED PLACES of MEETING for PUBLIC WORSHIP . . xxxix–xl

ABSTRACTS:—

MARRIAGES Registered in England in each of the Divisions, Counties, and Districts in 1856; distinguishing those according and those *not* according to the Rites of the Established Church; and distinguishing also Persons married according to their conjugal Condition, Minority, and Signature of the Register by marks 2–25

AGES of Persons married in 1856, distinguishing those of Bachelors, Spinsters, Widowers, Widows, and their Ages . 26–27

MARRIAGES, BIRTHS, and DEATHS Registered in each of the Divisions, Counties, and Districts in 1856; also BIRTHS and DEATHS and EXCESS of BIRTHS over DEATHS in each of the Sub-districts of England; showing Illegitimate Births, Area, and Population throughout 28–82

DEATHS in 1856 in the principal Public Institutions in London . . 83–84

BIRTHS of all Male and Female Children Registered in the DIVISIONS and COUNTIES, in each of the Four Quarters of 1856 . . . 86–89

BIRTHS of Male and Female Children born out of Wedlock Registered in the DIVISIONS and COUNTIES, in each of the Four Quarters of 1856 90–93

PAGE

ABSTRACTS — *continued.*

DEATHS of Males and Females, Registered in each of the Four Quarters of 1856, in DIVISIONS and COUNTIES 94–97

DEATHS of Males and Females at different AGES Registered in 1856 in DIVISIONS, COUNTIES, and DISTRICTS 98–119

CAUSES of DEATHS of Males and Females in ENGLAND, at different Periods of Life, in 1856 120–123

CAUSES of DEATHS of Males and Females in LONDON, at different Periods of Life, in 1856 124–127

CAUSES of DEATHS of Males and Females in ENGLAND, and in each DIVISION and COUNTY, in 1856 128–143

SUPPLEMENTARY TABLE of CAUSES of DEATH of Males and Females at different Ages in ENGLAND 144–147

AVERAGE ANNUAL RATE of MORTALITY from ALL CAUSES in the Ten Years 1841–51, and also DEATHS from SEVERAL CAUSES in 1856, in DIVISIONS, COUNTIES, and DISTRICTS of ENGLAND . . . 148–159

OCCASIONAL TABLES.

VIOLENT DEATHS in ENGLAND in the Five Years 1852–56, distinguishing SEX and AGES 162–169

DEATHS returned as having occurred from SUICIDE in ENGLAND in the Five Years 1852–56, distinguishing SEX and AGES . . . 170–172

DEATHS returned as having occurred from MURDER and INFANTICIDE in ENGLAND, in the Five Years 1852–56, distinguishing SEX and AGES 173–175

DEATHS returned as having occurred from MANSLAUGHTER in ENGLAND, in the Five Years 1852–56, distinguishing SEX and AGES . . 176–178

DEATHS returned as having occurred from LIGHTNING in ENGLAND in the Five Years 1852–56, distinguishing the AGE, SEX, and also the DIVISIONS and COUNTIES in which they occurred . . . 179–180

APPENDIX.

LETTER TO THE REGISTRAR-GENERAL ON THE CAUSES OF DEATH IN ENGLAND IN 1856, by WILLIAM FARR, ESQ., M.D., F.R.S. : —

PUBLIC HEALTH, METEOROLOGY, and PRICES OF FOOD in 1856 . 18

I. CAUSES OF DEATH 18

REPORT TO THE REGISTRAR GENERAL ON THE INTERNATIONAL STATISTICAL CONGRESS HELD AT VIENNA IN 1857, by DR. FARR 206–222

INDEX of DISTRICTS, referring by Numbers to the several TABLES of ABSTRACTS 223–231

REPORT

TO

'he Right Honourable SPENCER HORATIO WALPOLE, Her Majesty's Principal Secretary of State for the Home Department, &c. &c. &c.

General Register Office, Somerset House, 10th June 1858.

I HAVE the honour to submit to you the Abstracts of the Births, ths, and Marriages which were registered in England and Wales ng the year 1856.

he names of *one million three hundred and sixty-six thousand six lred and thirty-three* persons were enrolled on the national registers ng the year: commemorating the entrance of *six hundred and fifty- n thousand four hundred and fifty-three* living children into the lish community, the removal of *three hundred and ninety thousand hundred and six* men, women, and children from its ranks by death, and matrimonial union of *three hundred and eighteen thousand six hundred seventy-four* persons, by whom *one hundred and fifty-nine thousand e hundred and thirty-seven* new families were founded.

he natural increase of population, by the excess of births over deaths, *two hundred and sixty-six thousand nine hundred and forty-seven.* a defect of the English Registration Act, no one is bound under a ılty to give the Registrar notice of any birth; and in consequence a ain number of births is not registered. Hence the natural increase

---

ABLE I.—Estimated POPULATION, with the Number of MARRIAGES, BIRTHS, and DEATHS registered in England in each Year from 1838 to 1856.

Years ended Dec. 31st.	Estimated POPULATION in England in the Middle of the Years.†	MARRIAGES.	PERSONS *Married.*	BIRTHS (exclusive of Still-born).	DEATHS.	Excess of Births over Deaths.

1851	17,982,849	154206	308412	615865	395396	220469
1852	18,205,627	158782	317564	624012	407135	216877
1853	18,403,318	164320	329040	612391	421097	191294
1854	18,618,700	159727	319454	634405	437905	196500
1855	18,786,914	153113	304226	625048	425708	200340
1856	19,045,187	159337	318674	657453	390306	266047

'he Population has been deduced on the assumption that the annual rate of increase was uniform; viz. per cent. in each of the 10 years 1841-51, and 1·336 per cent. in each of the 3 years 1853-56. ncrease of Population has been obtained by taking the excess of births over deaths in the four quarters ng June 30th, in each year. The results, by the latter method, will probably be found now to be more correct those deduced on the hypothesis that the population increased at the same rate in 1851-2-3-4-5-6, as it n 1841-51.

of the English population is understated, by taking the difference betwe[illegible] the registered births—and the deaths which are nearly all registered. [illegible] account of the interference of emigration and immigration, of which [illegible] records are kept, it is difficult to estimate accurately the number [illegible] unregistered births. For the same reasons the actual increase of t[illegible] population since the last census cannot be accurately determined. [illegible] for practical purposes a sufficiently near approximation can be obtain[illegible] and the results on two of the most probable hypotheses do not differ c[illegible] siderably. Thus if it be assumed that the population has increased at [illegible] same rate since 1851 as it did in the previous ten years, the population [illegible] England and Wales must have been 19,107,366 in the middle of the [illegible] 1856; while by the method I have employed, which takes the excess [illegible] births over deaths as its basis, the population at the above date must ha[illegible] been 19,045,187. The latter number on account of the excess of emigr[illegible] tion during the period, is probably the nearest to the truth; and it is to t[illegible] former number as 1·0000 to 1·0033. The difference in the two numb[illegible] affects all the subsequent Tables—which are derived from a division [illegible] the recorded events, such as the births, deaths, and marriages—by t[illegible] population; but the extent to which they are affected is slight, as will [illegible] immediately evident on dividing the given proportions by 1·0033. Th[illegible] the annual rate of mortality per cent. given is 2·050; and by the oth[illegible] method it becomes 2·044, which differs from the first only, to the exte[illegible] of ·006.

The natural increase of the people was 731 daily.

The annual rate of increase was 1·375 per cent. by the adopt[illegible] method.

The marriages exceeded by 7224, the births by 22410, the marria[illegible] and births of the preceding year; and the deaths were less by 351 [illegible] than the deaths of that year. Hence the natural increase of the popu[illegible] tion was unusually great.

The population of the United Kingdom has not only increased at ho[illegible] but has sent out a swarm of emigrants. The number of English [illegible] Welsh emigrants was 64527, or, if we add a due proportion of the numb[illegible] whose birthplace is not returned, 72215; while the Scotch emigr[illegible]

TABLE II.—Proportion of MARRIAGES, BIRTHS, and DEATHS to the Population [illegible] England.

Years ended Dec. 31st.	To 100 Persons living.				The Number of Persons living.			
	MARRIAGES.	PERSONS MARRIED.	BIRTHS.	DEATHS.	To one Marriage.	To one Person Married.	To one Birth.	To one [illegible]eath.

Mean . .	·817	1·634	3·285	2·235	122	61	30	45

NOTE.—The Table may be read thus:—In the year 1838 to every 100 persons living there were ·771 [illegible]riages or 1·542 persons married, 3·029 births, 2·238 deaths; the number of persons living to every marriage [illegible] person married, birth or death, was 130, 65, 33, and 45 respectively. By disregarding the decimal points the [illegible] will show the proportion to every 100,000 persons living. A correction for increase of population has been [illegible] in calculating the [illegible].

ected were 13467, the Irish emigrants 80269. 10603 foreigners ed also from our ports. In the aggregate 176554 emigrants were re- ed by the Emigration Commissioners, of whom about 165951 were ives of these Islands, now the *officina gentium* of the north, which no ger sends forth armed barbarians over the settled states of Europe, or r the seas on piratical excursions, but distributes peaceful settlers r the uncultivated lands of Australia and of America.

n the year 1856, the rate of marriage in the population was 1·674 to persons living, of births 3·452, of deaths 2·050; or *one* person *married* very 60 persons living, one child was *born* to every 29 living, and one son *died* to every 49 living.

pon an average of *nineteen years* the annual rate per cent. of marriage 1·634, of birth 3.285, of death 2·236; or *one* person *married* to y 61, *one* birth to every 30, and *one* death to every 45 persons g.

Marriages.

33,619 marriages were celebrated according to the rites of the Estab- ed Church; and 25718 otherwise. The proportion of persons who ried according to the rites of the church was 84 in 100.

ABLE III.—Marriages registered in England in each Year from 1841 to 1856.

YEARS ending 31st December	Total Marriages.	According to the Rites of the Established Church.						Not according to the Rites of the Established Church.

Of the marriages according to the rites of the Established Church, 9 were stated to be by special licence, 21336 by licence, 104280 by banns, 4045 by superintendent registrars' certificate; in the registry of 3949 marriages these distinctions were not recorded by the clergy. Calculating upon the above number, it appears that of 100 of these marriages, 16·5 were by licence, 80·4 by banns, 3·1 by certificate. The proportions were the same in the previous year.

It will be observed that the marriages by licence, exhibiting some fluctuation, increased progressively up to the year 1854; in the year 1855 they fell off; but in the year 1856 they again increased, and exceeded the number of such marriages in the year 1854 by 288. Thus in the year 1856 a greater number of persons married by licence than had ever married before in that way. The marriages by banns also increased, but they did not equal in number the marriages by banns in 1854.

It was laid down in the two previous reports as the result of the returns, that a high price of wheat depresses marriage among the classes who marry by banns to a greater extent than it depresses marriage among the classes who marry by licence. Thus in the six years when the price of wheat was highest, the annual marriages per cent. on the population were ·801*, of which ·134 were marriages of the higher and middle classes, who when they belong to the Established Church marry by licence, and ·667 were artizans and labourers. When the price of wheat was lowest these proportions became ·831, and ·127 and ·704.

TABLE (*a*).

YEARS.	MARRIAGES. To 100 persons living.	MARRIAGES. By Banns to one Marriage by Licence.	Estimated to 100 persons living. *Marriages* of the higher and middle Classes.	Estimated to 100 persons living. *Marriages* of the Artizans and Labourers and other Classes.	Price of W[illegible] per Quar[illegible]r.

1850	·860	5·666	·129	·731	40 3
1851	·858	5·591	·130	·728	38 6

* Disregarding the decimal point, this will read 801 marriages were cele[illegible]brated to every 100,000 of the population; 134 were marriages by licence, 667 were mar[illegible]riages by banns. It may be assumed that these two groups represent the whole of the corresponding classes of so[illegible] whether belonging to the church or not.

This principle is further confirmed by the experience of another year. The average price of wheat in 1856 was 65*s.* 2*d.* a quarter; the marriages by banns were in the proportion of 4·888 to one marriage by licence. In the previous year, when the price of wheat was 74*s.* 8*d.*, the proportions were 4·883 to *one*. In the five years when the price of wheat ranged from 38*s.* 6*d.* to 50*s.* 1*d.*, and was 42*s.* 9*d.* on an average, the marriages by banns were to the marriages by licence as 5·530 to *one*, and ranged from 5·429 to 5·666 to *one*.

The number of marriages in the registered places of Roman Catholics was 7527, or a fourth part less than the number 9710 in the registered places of other Christian denominations not of the Established Church. 8097 marriages were contracted in the offices of superintendent registrars, without the performance of any religious rite.

The number of protestants and others who married was to the number of Roman catholics who married in registered places as *twenty* to *one*. Of 100 couples who married, 84 chose to be married according to the rites of the Church of England, 5 according to the rites of the Roman Catholic Church, 6 according to the customs of other Christian denominations; and 5 were married by the civil contract.

The Quakers married in unusual numbers; their marriages in the last three years were 52, 57, and 72. Their marriages in the last year were only exceeded in the years 1845 and 1847.

The marriages of Jews appear to be multiplying in England and Wales rapidly; the number in the registers of 1841 was 113, the number in 1849 was 229, and the numbers in the three years, of which 1856 was the last, were 287, 224, and 312.

Marriages of minors.—9120 young men and 29218 young women married under 21 years of age. Of 100 men who married 5·72, of 100 women who married, 18·34, were under age.

Early marriages have been growing every year since since 1848 more common. The proportion of young women under age was 13 in 100 married for the seven years 1841–47; and it increased every year afterwards up to 18 in 1854, which was again surpassed by the number 18·34 in 1856. The proportion of young men under age increased in the same years, but not to the same extent.

This involves an important change. It affects essentially the manners, the economy, and the increase of the population: it deserves to be carefully studied.

TABLE IV.—MARRIAGES. The Proportion per Cent. of *Minors* of each Sex, of Males and Females who *signed the Register with Marks*, and of Persons who were *Widowers* or *Widows*.

YEARS ended 31st December	To 100 Married.

† The proportion of Widowers and Widows in the Year 1841 is for the September and December quarters only.

It is necessary to bear in mind, that the mere fact that the proportion of marriages under age is higher in one population than in another absolutely proves that the disposition to early marriage differs only when the proportional numbers of unmarried women under and above 21 years of age is the same; for the real relative tendency to early marriage is measured in two populations, by dividing the annual marriages of minors in those populations by the numbers living unmarried at the corresponding ages.

TABLE V.—ENGLAND. MARRIAGES.—PROPORTIONAL Number of MARRIAGES in the several Counties of England during the Year 1856; of Persons who signed their Names; of Persons not of full Age; and of the Re-marriages of Widowers and Widows.

44	North Wales	·683	58·2	40·4	4·67	12·26	13·20	[illegible]

In London only 2·43 of 100 men, and 11·31 of 100 women, married under age; but this low proportion is partly due to the fact, that into London immigration introduces an excess of adults of the marriage ages, thus leaving the proportional number of minors living in London comparatively small.

The five counties which supplied the lowest *proportion* of males who married under 21 years of age were Middlesex (2·38), Surrey (2·63), Herefordshire (2·80), Westmorland (2·82), and North Riding of Yorkshire (3·34). The five counties which supplied the highest proportion of males were Northampton (8·78), Staffordshire (9·41), Hunts (10·07), Cambridge (10·27), Beds (10·90).

The counties which supplied the *lowest proportion* of *females* who married under 21 years of age were Herefordshire (10·92), Middlesex (12·03), the counties of North Wales (12·26), Shropshire (12·63), Somersetshire (13·16); while in Huntingdonshire (23·49), Cambridgeshire (24·55), the West Riding of Yorkshire (24·84), Durham (26·96), and Staffordshire (29·26), the proportion of young women marrying under the age of 21 was highest.

The actual ages of the young men and young women marrying under the age of 20, and a remarkable series of Tables, showing the ages of 92258 bachelors, spinsters, widows, and widowers who married in the year, will be found at pp. 26, 27.

Re-marriages. — 22,214 widowers and 14,915 widows re-married; 14,462 widowers married spinsters, and 7,163 widows married bachelors. Of 100 men who were married 13.94 were widowers; of 100 women 9·36 were widows. In the eight following counties more than 15 in 100 men marrying were widowers: Oxfordshire 15·04, Bedfordshire 16·01, Norfolk 15·66, Wiltshire 16·64, Somersetshire 15·99, Rutlandshire 15·69, Nottinghamshire 15·45, Cheshire 15·47. In London 10·83, Hampshire 11·04, Herefordshire 10·50, Staffordshire 10·86, Warwickshire 10·66, Lancashire 10·33, and Durham 10·01, the proportion of widows exceeded 10 in 100 women married. These numbers are regulated partly by the mortality, and partly by the disposition to re-marriage in the several counties.

Signatures of persons married.—113,437 men and 95,204 women wrote their names, 45,900 men and 64,133 women made their marks, in signing the marriage register. *Seventy-one* in 100 men wrote their names, and *twenty-nine* made marks. In 100 women *sixty* wrote their names, and *forty* made marks. If it is grievous to see how defective the elementary education of the people was about fifteen years ago, it is, on the other hand, gratifying to find in the table proofs of progress. The number of women who wrote their names increased from 51 to 60 in 100 during the years 1841 to 1856; the number of men who wrote their names increased from 67 to 71 during the same period. We have thus evidence of the progress of elementary learning from about the year 1826 to the year 1841, and may hope that the progress since that date has not been at a slower rate.

The intermarriages of persons who write their names with persons who sign by marks throws curious light on our social combinations. The last report contained some observations on the subject. In the year 1856 we find that in 81,542 marriages both parties wrote their names; that in 45,557 marriages one wrote and one signed with a mark; and that in 32,238 marriages both parties signed with marks.

The greatest possible number of marriages in which both parties could write their names was 95,204, for that was the total number of the marrying women *who could write*, while the actual number of such marriages (81,542) was less by 13,662 than the possible number. Again the utmost number of marriages in which both parties could not write was limited by the number of men (45,900) who could *not write*, while the actual

number of such marriages was 32,238, or less by 13,662 than the possible number.

If we now turn to the marriage of a man or woman who could write with a man or woman who could not write, it is found that 45,557 such marriages took place. Of the 318,674 persons marrying, 208,641 could write, 110,033 could not write, and it is evident therefore that if instead of 45,557 the whole of the 110,033 persons who could not write had married 110,033 persons who could write their names, these, with 49,304 marriages between persons who could write, would make an aggregate

NOTE.—The above numbers are for the Counties *proper*, and not for the "Registration Counties."

number of 159,337 families in which either the husband or the wife, or both, could write. This arrangement would be advantageous in some respects, as under it either the father or the mother in every family would be able to read and write; but it is overruled by the disposition of educated people living in each others society to intermarry. Given the number of men and women, educated and uneducated, as they may conventionally be called, the number of mixed marriages can be calculated by a simple mathematical formula, upon the hypothesis that the two classes of men and women marry indifferently. The results of the calculation are given in the annexed table. The number of mixed marriages is less by 27,527 than it would have been had no selection existed.

——	Numbers if no selection had existed.	Numbers as given in the registers.	Difference.
Husband AND wife *write* - -	67,779	81,542	+13,763
Husband OR *wife writes* (mixed marriages) - - - -	73,084	45,557	−27,527
Husband AND wife do not write -	18,474	32,238	+13,764
(1)	(2)	(3)	(4)

Upon comparing this table with the similar table of the last report, it will be observed that the figures in the fourth column of the two tables headed "Difference" are nearly the same; and that while the number of marriages in which the husband and wife do not write have increased by only 99, the number of marriages in which both husband and wife write has increased by 4808.*

Registered buildings for the solemnization of Marriages.—The number of these buildings on the register at the end of the year 1856 was 3811; 1322 of the number belonged to the Independents, 854 to the Baptists. 672 to the various sects of Wesleyan Methodists, 157 to the Unitarians, 473 to the Roman Catholics. The buildings of the following modern sects are not so numerous. The *Latter Day Saints* have *one* building registered for their marriages, the *Catholic and Apostolic Church* has 15, the New Church has 19 buildings.

Births.

Births (exclusive of the still-born).—657,453 children were born alive in the year, and the annual birth rate was 3·452 per cent., the average birth rate of the 19 years having been 3·285; it is the highest birth rate in the English records.

As has been already observed, all the births are not registered; and it must be borne in mind that the increase in 19 years, from 3·029 to 3·452, is in some degree due to the progress of the registration of births, which is partly voluntary and partly dependent on the zeal of the registrars in acquiring information.

The estimated number of women of the age 15–45 was 4,484,003, about 670,602 bore children in the year,† consequently 3,813,401 women of this age, that is 85 in 100 of them, or nearly *six* out of *seven*, bore no children. The resources for maintaining the supply of the population of England and Wales are thus abundant.

Durham (4·596) and Staffordshire (4·303) are the counties in which the birth rate is highest. In eight English counties the birth rate was below 3 per cent.; Hertfordshire 2·995, Berkshire 2·974, Herefordshire 2·931, Dorsetshire 2·911, Somersetshire 2·884, Rutlandshire 2·843,

* See 18th report, pp. vi & vii.

† The births of 657,453 children were registered, and it was shown in the seventeenth report, App. p. 72, that the births of 100 live-born children implied about 102 deliveries, after correcting for twins and still-born children.

Devonshire 2·827, Westmorland 2·797. In North Wales the birth rate was 2·911, in South Wales 3·548, in Monmouthshire 3·800. The birth rate is generally low in the agricultural, high in the mineral and manufacturing counties.

Sex.—335,541 boys and 321,912 girls were registered, so to 100·0 girls 104·2 boys were born alive. The proportions differ in the several counties. Thus in Surrey out of London, the boys were rather less than the girls in number; while in Wiltshire 109·3 boys were born to 100·0 girls. It is

st year that Wilts has stood at the head of this list. The propor-
fluctuate from year to year.

sons.—The births were most numerous (173,263) in the second
er, and least numerous in the third quarter of the year. If the
ge number of quarterly births be represented by 1000, the propor-
numbers in the four quarters will be represented by 1035, 1060,
and 953. In the previous year these proportionals were very
nt: 1060, 1044, 966, and 930.

VIII.—ENGLAND. BIRTHS 1856.—PROPORTIONAL Number of BIRTHS regis-
in each Registration County in the Year 1856, and in each Season of the Year,
e Number of Births in each Quarter to 1000 Births in the Average Quarter.

ISTRATION COUNTIES.	BIRTHS to 100 Persons living.	Proportional Number of Births registered.*				
		In the AVERAGE QUARTER assumed to be 1000.	In the FIRST QUARTER ending March 31.	In the SECOND QUARTER ending June 30.	In the THIRD QUARTER ending Sept. 30.	In the FOURTH QUARTER ending Dec. 31.

calculating the proportional number of births in the four quarters a correction has been made for the
ce in the number of days in each quarter.

Children born out of wedlock.—42,651 children, namely, 21,655 boys and 20,996 girls, were born out of wedlock in the year. The proportion is 6·5 born out of wedlock, to 93·5 born in wedlock in every 100 children born; or nearly as 1 to 14. The proportional number of illegitimate children is higher than it was in the two previous years. This is observed in London, in Lancashire, in the East and West Ridings of Yorkshire, in Northamptonshire, in Bedfordshire, in Norfolk, in Dorsetshire, in Gloucestershire, in Warwickshire, in Leicestershire, in Nottinghamshire, in Derbyshire, and in Monmouthshire. The increase is chiefly in the manufacturing counties, where the proportion is not generally high. In five counties more than 9 in 100 children are born out of wedlock: Cumberland 10·5 and Westmorland 10·5 are at the head of the list; Norfolk 10·3 is nearly equally bad; Shropshire 9·4, and Herefordshire 9·3 are little better. In the following counties less than 6 in 100 children are born out of wedlock: Kent 5·9, Huntingdon 5·6, Devon 5·6, Cornwall 5·1, Stafford 5·8, Warwick 5·7, Durham 5·4, Monmouth 5·3. In London the proportion of children so registered is 4·2. In the parts of Surrey and Middlesex out of London the proportions are 4·7 and 4·9. In the large towns it is probable that the children born out of wedlock are not registered to the same extent as other children.

1856 - -	4,484,008	637,453	14·7	15·0
1	2	3	4	5

* The number of *children born alive* is to the number of *women bearing children* (including those who bear still-born children), nearly as 100 to 102. See the data of this estimate in the 17th Annual Report, Appendix, p. 72. The figures in col. 5. are deduced by multiplying the figures in col. 4. by 1·02.

The proportional number of children who are born without the means of sustenance and of education, which the marriage of the parents supplies, is shown with considerable accuracy; and the degree of this evil in different counties is measured. Where the proportion of illegitimate children is low, it must not, however, be assumed at once that this implies in all cases superior morality in the population; for the manners of different counties greatly vary, and immorality displays itself in many ways besides those which have for their result the birth of children out of wedlock.

Deaths.

390,506 deaths were registered in the year, or less by 35,197 than the deaths in the previous year; and the rate of mortality was 2·050 per cent., or little more than 20 deaths in 1000. This is the lowest rate observed. The average annual rate of mortality in the nineteen years was 2·236 (nearly 22 in 1000); and the rate ranged from 2·050 (one in 49) to 2·512 (*one* in 40).

Sex.—The mortality was at the rate of 2·125 per cent. among males, 1·978 per cent. among females; showing an excess of 0·147 among males. The deaths of males were to the deaths of females as 104 to 100. The female population exceeds the male population; and if an equal given number of males and females be taken, the deaths it will be found were in the proportion of 107 males to 100 females. On an average of the nineteen years the mortality of males was to the mortality of females as 108 to 100.

Highest, lowest, and mean annual Rates of Mortality,—per Cent.

	Males.	Females.
(1.) Highest rate, 1849 (cholera epidemic) - - -	2·581	2·445
(2.) Mean rate, 1838–56 - - - - -	2·316	2·155
(3.) Lowest rate, 1856 - - - - -	2·125	1·978

1853 - -	2·379	2·201	104	108
1854 - -	2·434	2·273	103	107
1855 - -	2·348	2·187	104	107
1856 - -	2·125	1·978	104	107
Average of 19 years, 1838–56 - -	2·316	2·155	103	108

The Table may be read thus:—In the year 1838 to every 100 males living there were 2·335 deaths of males; to every 100 females living there were 2·133 deaths of females; and to every 100 females who died there were 105 deaths of males. The last column shows the *relative* mortality of *males* and *females;* and that out of *equal numbers living* the deaths of males were 109 to every 100 deaths of females in 1838.

It will be observed that the mortality is raised in some years much above the average rate, and that the depression in the rate is not to the same extent. In unhealthy populations the range in the mortality rate is much higher than the range among healthy people.

Note.—In deducing the results given in this Table a correction has been made for increase of popula based on the numbers enumerated in 1841 and 1851, on the assumption that the increase was uniform in e year (1841–1851). *Since* the Census of 1851, as no satisfactory data exist for ascertaining the progress of population, which has been much interfered with by emigration and other causes, the increase has been ta to be approximatively represented by the excess of births over deaths registered in each respective y *ending June 30th.*

The mean mortality of females is lower than the mean mortality of males, yet the range is more extensive.

Localities.—The annexed Tables show that the mortality in 1856 was below the average in every county of England, except in Durham. In some counties the mortality was unusually low: thus the mortality was 15 in 1000 in Westmorland; less than 16 in 1000 in Dorsetshire and the great county of Lincolnshire; less than 17 in 1000 in Oxfordshire, Devonshire, Somersetshire, Rutlandshire, and the North Riding of Yorkshire. The mortality of London was less than 22 in 1000. The mortality was highest in Durham (24·54), and in Lancashire (25·54); where, with all their energy, many of the governing bodies have left the towns deplorably destitute of satisfactory sanitary arrangements.

Ages.—The mortality varies at every age. It is lowest at some period between the age of ten and fifteen years. In the year 1856 the rate at that age was ·450 per cent. in both sexes, or 4·5 deaths in the year to 1000 living; the average mortality of boys during nineteen years being 5·27, of girls 5·48. The vital force, or the power of resisting dissolu-

* The *Hectar* is the unit of land measure in the Metrical system, and it is equal to a square of 100 *Meters*, = 109·3633 yards, to the side. It is equivalent to 2·471143 (nearly 2½) Statute *Acres*, or, expressed in other terms, a Statute *Acre* represents ·404671 (rather more than 4-10ths) of a *Hectar*.

tion, increases rapidly from the date of birth up to this age of puberty; so that every year a child's chances of living grow greater. After the age of puberty, when the body in every other respect is acquiring strength, the power of resisting disease declines slowly up to some age about 55 years, and then more rapidly. Thus in the first five years of life 68 in 1000 boys, 59 in 1000 girls die annually; in the second five years (age 5–10) of life 7 in 1000 boys, and 7 in 1000 girls die annually. In the ages commencing at 15, the deaths to 1000 males living in each of the successive periods of ten years, up to the age 55, were nearly 7, 9, 12, 17; at 55 and upwards 30, 61, 129, 263, 322. The female mortality follows the same law; but it was lower at all ages except 5–10, 15–35, 95 and upwards, than the mortality of males. At all ages and in the two sexes the mortality was below the average in the year 1856.

The seasons.—The winter quarter of 1856 was mild, and 103,014 deaths were registered, whereas the deaths in the severe winter quarter of 1855 had amounted to 134,542. The relative rates of mortality in the seasons of 1856, taking 1000 as the standard, were 1061 and 1031 in the winter and spring quarters, 928 and 980 in the summer and autumn

The Table may be read thus:—Of 100 Males living of the age of 35 and under 45, 1·272 died in 1846, 1 in 1847, and so on for other years, a correction for increase of Population having been made for each A in each Year; and the deaths of persons whose ages were not returned have been distributed proportionally over ach age. The data upon which this Table is constructed appear in this or have appeared in the previous Reports, in the Census Report. *See* Census Report 1851; and the Annual Reports of the Reg. Gen., particularly the 8th and

ers. This is shown below. The effects of the seasons are shown subsequent summary of the observations which are taken from the erly Reports.

SUMMARY OF THE QUARTERLY REPORTS, 1856.

First Quarter.—January, February, March, 1856.

re than the average number of children were born, and the deaths much below the average number in the winter quarter; the mar- were below the average number.

rriages.—66,854 persons were married in the three months of Ja-, February, and March. The annual rate in the quarter was 708 ages to every 100,000 of the population; while the rate in the r of 1855 was 633 (or less by 1-tenth), and the average rate of the ling winter quarters was 705. The marriages (33,427) were more 41 than the marriages (29,186) in the winter quarter of 1855; and ncrease is a sure indication of the prosperity of the country. The se of marriages is observed in every division. The excess in the ers in Portsmouth, Plymouth, and Hull is probably due to the n of our gallant seamen from the Black Sea and the Baltic.

1856	97627	1000	1061	1031	928	980

Births.—The births of 169,250 children were registered; this number is absolutely the highest that has ever been returned in a winter quarter; and the rate of birth is 3,585 in 100,000, or much above the average 3,498 of the season.

Increase of Population.—As the number of births amounted to 169,250, and the number of deaths to 103,014, the natural increase of population in the quarter was 66,236 in England. The number of emigrants of English origin during the three months was about 10,545, half of whom sailed for the Australian colonies, while nearly all the rest sailed to the United States. After deducting the emigrants, the increase is 55,499. The emigration from the United Kingdom was at its maximum about the year 1852, when 58,291 emigrants sailed from the stations in the winter quarter; the numbers fell to 36,677 in 1855, and to 21,859 in the first quarter of the present year.

The Weather, and the Price of Provisions.—The weather, the price of provisions, and the state of employment have considerable influence on the births, deaths, and marriages.

The mean temperature of the air was on successive days alternately higher and lower than the average in January and in February; it was low in March; but upon an average of the three months the heat predominated. The fall of rain was 4·8 in. at Greenwich, which is slightly below the average.

The prices of provisions are still high; wheat has been on an average 72*s.* 4*d.* the imperial quarter through the last three months, which is higher than the average price (69*s.* 11*d.*) during the winter of 1855, but lower than the average (79*s.* 6*d.*) of the winter of 1854. The wholesale prices of beef (5¼*d.* a pound) and mutton (5⅜*d.* a pound) have been slightly lower than they were in the two previous winters. Potatoes in the three winters fell from 140*s.* a ton in 1854 to 112*s.* 6*d.* in 1855, and to 86*s.* in 1856, so that the price of this important article of food has progressively fallen.

State of the Public Health.—The rate of mortality has been much lower in the first quarter of this year than it has been in any winter quarter since 1846. The rate is on an average in winter 2·524 per cent. per annum; in the past quarter it was only 2·182. The contrast between this rate of mortality and the rate of mortality in the winter of 185[illegible]5 is striking; the rate was then 2·916. The deaths in the first three months of 1855 were 134,542; in the first three months of the present year 103,014, or less by 31,528 than the deaths in the previous winter. The deaths of Englishmen in the Crimea are not registered in England, otherwise the addition of their numbers would make the difference between the loss of life in the two winters still greater. The high mortality of the army in the Crimea (1856), as well as the low mortality on that distant coast (1855), coincide with less intense but corresponding states of the nation at home.

A difference in the degrees of heat and cold appears to have been the chief cause of the difference in the mortality in England. The mean temperature at Greenwich was 34·1° in the winter quarter of 1855, and 40·0° in the winter quarter of 1856. The mean temperature of the month of February 1855 was 29·4° (2·6° below the freezing point of water), and the mean temperature of February 1856 was 42·0°, or 10° above the freezing point of water. The fatality of every degree of cold below the freezing point to old people is now well established; but a mild winter is sometimes followed by an unhealthy autumn, against which our Health Officers should be watchfully on their guard.

A new sub-division of the country has been made; and with a view to placing in one group the town population, 125 entire districts have been selected, which, together with 23 sub-districts, embraced in 1851 a population of 8,247,017 persons lodged on 2,149,800 acres of land, leaving

9,680,592 persons on the remaining 35,175,115 acres, which make up the territory of England and Wales. In round numbers there were 4 (or more exactly 3·836) persons to an acre in these large town districts, and one person to 4 (or more exactly 3·634) acres in the village and small town districts, so that the density of the population to a square mile in the two groups of districts was as 1 to 14.

The average rate of mortality in the last ten winters has been 2·524 per cent. per annum in all England; but the rate in the town districts has been 2·745, and in the other districts 2·282 per cent. per annum. The rates of mortality in the winter of 1856 were much below these averages; the town rate was 2·482, the other rate 1·915, the rate for the country generally 2·188.

The importance of these results is enhanced by the facts in the table, showing that the great increase of the population of England in the ten years after 1841 was found in 1851 to be lodged in the towns. The population of the large towns was 6,838,069 in 1841, and 8,247,017 in 1851. The question of the health of towns is therefore a question of the strength of England.

The principal cause of the insalubrity of the dense districts is the want of adequate means to redistribute over the earth the organic matter which is reduced to refuse in the towns; and any proposal to throw the town guano wastefully into the rivers of the kingdom would be an imperfect and an unsatisfactory solution of the problem.

The mortality fell in every division; and in every county some improvement appears.

In the SOUTH-EASTERN DIVISION typhus and scarlatina are referred to in some districts; and the syphilitic gangrene which broke out in the previous quarter in Winchester caused 3 deaths at the commencement of this quarter. But the garrison is healthier that it was at Winchester; and the good effects of sanitary measures are already observed at Southampton.

In the SOUTH MIDLAND DIVISION 4 deaths from scarlatina occurred in one family in the Hatfield district. In Halton, near Runcorn in another Division, the family of a gamekeeper suffered severely:—"One of his children died on the 26th March, a second on the 27th, a third on the 28th, and a fourth on the 31st. Two other children, who are at home, have also had the fever, but are likely to recover." It would be well if the treatment were ascertained in these cases. Ten children died of croup at Haddenham in the Ely District; and croup also prevailed in Prittlewell, Rochford.

In the EASTERN DIVISION typhus visited some of the Essex districts; ague is prevalent in Tollesbury. About 60 persons were attacked by small-pox in the parish of Finchingfield, and 4 died.

In the SOUTH-WESTERN DIVISION the good effects of the sanitary arrangements are noticed at Highworth, and notwithstanding the prevalence in some places of scarlatina and of typhus the general mortality was low. The registrar of Charles the Martyr, Plymouth, says, "the number of twins is remarkable, 8 double births having been registered; two more cases occurred, but as the children were still-born no entry could be made of them." The births of twins are also noticed in Falmouth and in a northern district, Chorlton-upon-Medlock, where one quadruple birth has been registered (three boys and a girl), together with six twin births. It is difficult to say whether these births thus occurring are referable to any general law, or are merely accidental fluctuations in small numbers.

The reduction of the mortality in the WEST MIDLAND COUNTIES is striking, and extends over the mining districts. The deaths in Birmingham and Aston were 2094 and 1504 in the winter quarters of 1855 and 1856. One of the registrars of Coventry points out the defects which are now generally recognized in the Vaccination Act.

In some districts of Lincolnshire and of Nottinghamshire typhus and scarlatina have prevailed; but taking the whole of the NORTH MIDLAND DIVISION the rate of mortality has been lower than it was in the two preceding winters.

In the NORTH-WESTERN DIVISION the deaths are below the average. The registrar of Stockport says:—"That there is an entire absence of fever, and that sanitary arrangements have been carried out by the corporation with the most salutary effects." 3319 persons died in Liverpool and West Derby; the deaths in the winter of 1855 were 3674. In Manchester and Salford the diminution of mortality has been greater; the deaths fell from 3261 in the winter of 1855 to 2301 in 1856. It is gratifying to observe that the number of persons who obtain medical attendance in Manchester is now much greater than it was formerly; and to this circumstance, in conjunction with others, Mr. Leigh, the registrar of Deansgate, conceives it not improbable that the diminished mortality is due. His observations on this important subject are subjoined:—

473; 2. MANCHESTER; *Deansgate*.—Births 292; Deaths 209 Of the 209 deaths (a number much below the average for this quarter) 16 were coroners' cases, leaving 193 as the mortality from ordinary causes. Of these 147 were certified; 27 had medical attendance, though certificates were refused, and are therefore entered as "not certified." 20 only had no medical attendance, and these were chiefly very young children. The large proportion of cases in which there was medical attendance, being more than nine tenths o the whole, coupled with the very small actual mortality, would be very gratifying if on could be quite certain of the relation between the two circumstances. It cannot b questioned that skilful aid rendered in sickness must often prevent death, and from th numbers here given it is to be supposed that all had this with the exception of 20. may be inferred, therefore, either that medical aid is more within the reach of the po than formerly, or that the confidence of the people in skilled labour over intuitive kno ledge is rather on the increase. There is a third hypothesis somewhat less flattering, th inasmuch as by a recent Act of Parliament copies of registers of deaths wherein a sta ment whether or not there has been any medical attendance included, must be produc before any money can be obtained from children's burial clubs, this may have had so thing to do with the more general application for skilled medical aid. Be the cause w it may, however, it is a fact that whilst for several years after the certificate system adopted in registration, not *more than one half of the cases were certified to have had pro medical attendance, the number in the last quarter amounts to more than nine-tenths.* cases enumerated as "not certified" were nearly all attended by one or two surge who have lately refused to give certificates altogether. The continued and steady co of sanitary improvement, together with the unusually fine winter that we have had, also undoubtedly have diminished the usual amount of sickness and consequent morta Nor must we lose sight of the influence of the war in diminishing employment, by w the mothers are retained at home, looking after their children, instead of being occupi labour elsewhere. The occupation of adult females in mills, however conducive it m to their comforts by increasing the total earnings of families, is really the opprobriu our manufacturing system. The children of such mothers are left to the care of children but little older than themselves. Irregularities in times of feeding, improper neglect for long intervals in sickness, scanty clothing, exposure to inclement weather the free use of opiates, all work their effects on the poor little creatures, and the w is, not that so many should die, but that so many should live. Burns, scalds, &c. fro same source of neglect, swell the coroners' lists. Of the 209 deaths 108, or rather than half, were under 5 years old, and one fifth of the whole under 6 months old.

The decrease of the number of deaths in YORKSHIRE is 1872. In the three last winters the deaths in Leeds and Hunslet districts have descended from 1374 and 1321 to 1136; in Sheffield from 807 and 889 to 762; in Hull and Sculcoates from 532 and 657 to 472.

In the NORTHERN DIVISION the mortality of Durham remains nearly as high as it was in 1855; scarlatina is epidemic in many districts.

In MONMOUTHSHIRE and WALES the deaths, which were 9098 in the winter of 1855, fell to 6777, or they were less by 2321 than the deaths in the cold winter of the last year.

Second Quarter.—April, May, June, 1856.

The marriage rate, which was low, now approaches the average rate; the birth rate is high; and the death rate is low; so that the state of the population, in the light of these returns, is favourable.

Marriages.—77,640 persons were married in the three months of April, May, and June; and the marriage rate of the quarter was ·819 per cent. per annum. The average rate of the quarter is ·855. The marriages (38,820) exceed by 271 the marriages in the corresponding quarter of the year 1855, but are fewer by 1698 than the marriages in the spring quarter of 1854. The decrease of marriages is most obvious in London, in Sussex, in Bucks, in Somerset, in Gloucester, in Leicester, in Nottingham, and in North Wales. In Berks, Northampton, Suffolk, Devon, the North Riding of Yorkshire, Cumberland, Westmorland, and South Wales the marriages increased.

Births.—173,263 boys and girls were born alive and registered in the spring quarter that ended on the last day of June; giving an increase of 7986 children on the numbers of the corresponding quarter of 1855. It is the spring quarter in which the greatest number of births generally occurs; and this number is the highest that has ever been returned in England. The number of registered births rose from 136,941 in the spring quarter of 1844 to 173,263 in the last spring quarter.

Increase of Population.—As the number of births was 173,263, and the number of deaths 100,099, the natural increase of the population of England was 73,164 in the three months of April, May, and June; so 1904 lives were added, 1100 were taken away, daily; leaving 804 as the daily increase. But in the same three months 60,379 emigrants left the ports of the United Kingdom at which Government agents are stationed; and of that number about 21,304 were of English *origin*. England, exclusive of Scotland and Ireland, sent about 234 emigrants daily over the seas, to Australia, to the United States, and to the North American colonies. Of the immigrants who enter England, from Scotland, Ireland, and other parts, no statistical records are kept.

The emigration from the ports of the United Kingdom is less by nearly 6000 than the emigration (66,111) in the spring quarter of 1855, and is little more than half the emigration (113,141) in the corresponding quarters of the eight years 1847–54.

The Price of Provisions, and the Weather.—During the last three months, wheat was sold on an average at the rate of 68*s.* 8*d.* a quarter; Yorkregent potatoes at 80*s.* a ton, at the waterside market, Southwark; beef at 5¼*d.* a pound, mutton at 5⅞*d.* a pound, in the Leadenhall and Newgate markets. The price of wheat in the corresponding three months of 1854, 1855, and 1856, declined from 78*s.* 4*d.* to 68*s.* 8*d.*, or nearly 10*s.* a quarter; potatoes fell from 155*s.* to 80*s.* a ton; beef fell only from 5⅜*d.* to 5¼*d.* per pound; mutton, on the other hand, rose from 5⅝*d.* to 5⅞*d.* per pound. Upon the whole, the prices of articles of most extensive consumption, as food, declined.

The value of the public securities rose.

State of the Public Health.—The deaths in the three spring months were 100,099; and the annual mortality was at the rate of 2·112 per cent. or nearly 21 in 1000; the average annual rate of the season being nearly 23 in 1000. The mortality has been, during the whole of the half year past, much below the average rate.

The mortality in the spring quarter among the people living in the districts and the sub-districts comprising the chief towns of England was at the annual rate of 23·81 (nearly 24) per 1000; the mortality of the rest of the people in the small towns and in the country parishes was at the annual rate of 18·73 (nearly 19) per 1000. The rate of mortality is in both classes of districts below the average; but the reduction of the rate is less considerable in the town than in the country populations.

The changes in the diseases and the low mortality that has reigned in London have been noticed in the Weekly Tables. The salutary effects of the improved water supply, and of other sanitary measures, in

idsey, are pointed out by one of the registrars; as ...
in Lambeth and other districts are referrable to the same ca...
ole of the results can be collected and discussed most conveniently
er when a greater number of facts has accumulated.

e deaths (8127) in the SOUTH-EASTERN COUNTIES are below the
ge number; and nearly a thousand less than the deaths in the
g quarter of the previous year. In Kent the deaths slightly ex-
ed the average; in Surrey, Sussex, Hants, and Berks, the decrease
well marked. Scarlatina and measles prevailed in some districts of
nt; at Faversham malignant scarlatina prevailed through the whole
arter, and the deaths were nearly doubled. The registrar of Newport
the Isle of Wight states, that he has registered 4 deaths from small-
ox in the Parkhurst barracks. In the Isle of Wight generally, in the
ew Forest, and in some other districts of the division, the mortality has
een at as low a rate as 16 in 1000.

The SOUTH MIDLAND COUNTIES were generally in a healthy state; the deaths in the quarter were 6283. In Oxfordshire, Northamptonshire, and Huntingdonshire, the mortality was nearly at the average rate; in Buckinghamshire and in Cambridgeshire the rate of mortality was much below the average. Small-pox was very prevalent in Northampton; and the deaths from all causes were 294; so the mortality was at the annual rat... of nearly 35 in 1000. At Cambridge the deaths during the last thre... spring quarters were 155, 151, and 110. The registrar of St. Andrew... Cambridge, says:—

> The decrease in the deaths compared with those of the same quarter in 1855 spe... well for the healthy condition of this district, and may in some measure be accoun... for by the introduction of a *large and constant supply of water last autumn*, in pipes fro... distance of 2 or 3 miles, which will not only be the means of great comfort and c... venience to the inhabitants, but will also materially assist in cleansing the town. S... latina appears to be the most prominent, if not the only, disease among children.

The beneficial effects of a constant supply of pure water on the he... of the town populations become every day more apparent.

The deaths in the EASTERN COUNTIES were 5735, while the num... in the previous spring quarter were 6187. The mortality was lo... Norwich. Scarlatina in a severe form prevailed in Epping, G... Warley, Bradwell, Hempstead (Parish), South Walsham and Hilling... The fishermen in King's Lynn *North* refuse generally to have ... children vaccinated; and *ten* died of small-pox.

The SOUTH-WESTERN COUNTIES lost 8490 of the inhabitants by de... but the mortality was low in every county, and the deaths were 1162... than the deaths in the spring quarter of 1855. At Trowbridge in W... it is gratifying to find that many families have removed with the... effect from unhealthy yards to healthy cottages, with small gar... attached, in the outskirts of the town. The improvement of the ho... is sure to be followed by the improvement of the inhabitants. The... nicious effects of the nightsoil, which is still left under the houses in... towns, have been fatally proved in Poole; where *three* men died f... descending into the vaults. The registrar remarks:—"If the mac... with hose had been used, this sad result, which has rendered seven chil... fatherless, and three wives widows, could not have occurred."

In proceeding northwards, the diminution in the mortality of the d... sions is less considerable. In Staffordshire and in the other countie... the WEST MIDLAND DIVISION the deaths exhibit a decrease. 1134 de... were recorded in the Birmingham district. Small-pox, scarlatina, ... measles prevailed in some districts.

In the NORTH MIDLAND COUNTIES 6282 deaths were registered. Lincolnshire a remarkable decrease is observed in the deaths, which ... 2064, 2256, and 1712 in the three last spring quarters.

The deaths in the NORTH-WESTERN DIVISION were 16,035; nam... in Cheshire, and 13,717 in Lancashire. The numbers are a l...

below the average. Liverpool and West Derby exhibit a gratifying decrease in the mortality; the deaths in the two districts were 2797 to a population of 411,515 in 1851. The registrar of the West Derby sub-district makes the following remarks:—

> My district during the whole of the quarter has been in a more healthy state than at any former period; so much so, that during the week ending Saturday the 24th May there were only 3 deaths in the whole sub-district, which at the census of 1851 contained 33,013 inhabitants, and there will be an increase on that number of at least 5,000 since that time. The township of West Derby has always been noted as the most healthy locality in the vicinity of Liverpool, and this usually favourable state of the district is further improved by the excellent system of draining, sewering, and cleansing the streets that has been adopted. The births have for some time past been double the number of the deaths, owing to the healthy state of the district and the increased population.

Sanitary measures in Liverpool will, we may hope, henceforward reduce the high mortality which has reigned there, and to which the attention of the authorities was first called in these reports.

10,707 deaths were registered in YORKSHIRE; and of that number 1356 occurred in Bradford, to a population of 181,964 in 1851; 1241 were registered in Leeds and Hunslet; 694 were registered in Sheffield.

The 5835 deaths in the NORTHERN COUNTIES slightly exceed in number the deaths in either of the two previous spring quarters. Small-pox and scarlatina have prevailed. Vaccination is evidently neglected among the colliers. The mortality increased in Durham and in Northumberland; decreased in Cumberland and in Westmorland.

In WALES and MONMOUTHSHIRE 6722 deaths were registered; the deaths in the previous spring quarter were 7366. Small-pox and scarlatina have prevailed epidemically in some districts.

At this season of the year, when many people are travelling on the continent, as well as in England, it may be useful to state that it is now well established by extensive observation, that England is the healthiest country in Europe. France stands next to England in salubrity. In the continental cities the annual rate of mortality is seldom less than 30 in 1000; and the rate frequently rises to 40 in 1000. In London the rate of mortality is 25 in 1000.

On an average of ten years (1841–50) the mortality was at the annual rate per 1000 of 15 in *three* English districts, 16 in *fourteen* districts, 17 in *forty-seven* districts, 18 in *eighty-seven* districts. These facts prove that the climate of England is eminently salubrious; and it has not yet been shown that the climate of any part of the continent is more salubrious than this island, crowned with hills of moderate elevation, sloping towards the east and the south; bathed by the showers of the Atlantic; drained naturally by rivers running short courses to the sea; cultivated more extensively than other lands; and producing those unequalled breeds of sheep, cattle, and horses, which flourish only in healthy places.

The healthiest parts of England are not yet places of general resort; but the annual mortality in the various districts, comprising watering places, seldom exceeds 21 in 1000 of the population; and is probably lower in those regions of the districts to which visitors resort. The annexed Table shows the mortality of some of the principal English watering places. It will be observed, on inspecting the last column, and comparing the deaths with the population, that Hastings, Brighton, the Isle of Wight, Worthing, Mutford (including Lowestoft), Newton Abbot, Barnstaple (including Ilfracombe), Bath, and Cheltenham, have experienced low rates of mortality during the spring quarter. And it should be always borne in mind, in selecting places of resort, that through the peculiar nature of zymotic diseases, places usually healthy are periodically visited by epidemics, which can only be avoided by consulting recent returns, or by actual inquiries on the spot. The cleansing and the

sewerage of all watering places require improvement, as their arrangements were made when sanatory science was at a low ebb.

MORTALITY in the Districts containing some of the principal English Watering Places.

DISTRICTS.	Deaths annually to 1000 persons living during the 10 years 1841 to 1850.	DISTRICTS.	Deaths annually to 1000 persons living during the 10 years 1841 to 1850.
TUNBRIDGE (including Tunbridge Wells)	20	BATH	24
THANET (including Ramsgate and Margate)	19	CLIFTON (including part of Bristol City and Bristol Workhouse)	23
DOVER	21	CHELTENHAM	20

		ANGLESEY	17

Third Quarter.—July, August, September 1856.

The marriages are above the average in number; the births are abo[illegible]bove and the deaths are below the average. Thus, although the high price [illegible]ce o[illegible] provisions keeps the marriage rate below the high rate which preva[illegible]ailed some time ago, the increase by birth and the public health of the Engli[illegible]nglish population present in the returns a favorable aspect.

Marriages.—78,178 persons married in the quarter that ended [illegible]d on September 30th, 1856; and this number exceeds by 3562 the number [illegible]er o[illegible] persons who married in the summer quarter of 1855. The marriag[illegible]riages rose from 37,308 to 39,089. An increase in the marriages is observa[illegible]vabl[illegible] in every division. There is an increase in Kent; and a larger increa[illegible]reas[illegible] of marriages in Hampshire, which is partly due to the return of seam[illegible]amen from the war; for the marriages in the Portsea Island District, includi[illegible]ludin[illegible] Portsmouth, were 156, 211, and 334, in the corresponding summ[illegible]ummer quarters of 1854–56. In Devonshire the increase of marriages is a[illegible]s al[illegible] considerable; in Plymouth and the adjoining districts of East Stonehou[illegible]thou[illegible] and Stoke Damerel, the marriages in the same three quarter were 31[illegible]31 330, and 514. In Norfolk the chief increase was in Norwich. In La[illegible]La[illegible] cashire and Yorkshire the marriages increased but little. In Susse[illegible]esse[illegible] Wilts, Dorset, Gloucester, Salop, Rutland, Derby, Cheshire, and Nort[illegible]ort[illegible] umberland, the number of marriages was less in the summer quarter [illegible]er 1856 than in the same quarter of 1855.

The rate of marriage was 813 to a hundred thousand living in t[illegible]t summer quarter of 1856; the average rate of the 10 quarters preceding[illegible]di[illegible] was 805.

Births.—157,462 children, who were born alive, were registered in t[illegible]n t[illegible] quarter ending on the last of September. The birth-rate of the quart[illegible]ar[illegible] is 3·275 per cent. per annum, while the average rate is 3·208. T[illegible]T[illegible] number of births exceeds by 2762 the births in the corresponding quart[illegible]ar[illegible] of 1855, and is the greatest that has ever been registered before [illegible]re England in the corresponding quarter of the year. An increase in t[illegible]n t[illegible] births is observable in every division, except the North Midland divisio[illegible]sio[illegible] the North Western Division, and Yorkshire.

Increase of Population.—As the births amounted to 157,462, and t[illegible]th deaths to 91,155, the natural increase of people in the quarter w[illegible]was 66,307. We have no returns of the immigrants into England and Wal[illegible]les. The emigrants from the ports of the United Kingdom at which th[illegible]here

ure government emigration agents amounted to 50,228, of whom 19,225 were of English origin, if a due proportion of the numbers (6907) of origin not distinguished be added to the 16,581 returned: 8542 sailed to the Australian Colonies, 973 to the North American Colonies, and 9710 to the United States.

The number of English emigrants exceeds by 3695 the number in the summer quarter of the year 1855.

The Price of Provisions, and the Weather.—The mean temperature of the quarter at Greenwich was 59·9°, and differed little from the average of 15 years; but the month of August was hotter, and the month of September was colder, than is usual. The air was dry in August, moist in September. The rain-fall of 5·8 inches was in defect in July and August, but in excess in September; it was on the whole 1·2 inches below the average. The wind blew at the average rate of 77 miles daily; but the rate was only 44 miles in August. The barometer stood at 29·743 inches, which is ·071 inches below the average. The weather is described by Mr. Glaisher, who also shows in his tables the meteorological variations at different places.

The fluctuations of the price of provisions can be traced in Table XX. Wheat was at the average rates of 63*s.* 10*d.*, 76*s.* 1*d.*, and 72*s.* 3*d.* during the months of July, August, and September in 1854–5–6. It should be noticed that the wheat and the wheat flour entered for home consumption were equivalent to 117,807 quarters weekly during the last three months, which is more than double the quantity entered in the corresponding weeks of 1854 and 1855; while the quarters of wheat sold weekly (78,208) have been less in number than the quarters (94,545) sold in the corresponding weeks of 1855. Wheat then is still dear. Beef, at 5½*d.* per lb. by the carcase, is cheaper by 7 per cent. in the London markets than it was in 1855. Mutton has been 6*d.* a pound during the three last summers; and in those seasons potatoes at the Water-side market, Southwark, have differed little from 78*s.* a ton, or ½ lbs. for a penny wholesale.

State of the Public Health.—91,155 deaths were registered in the three months of July, August, and September; and the death-rate was 1·896 per cent. per annum, the average rate being 2·198; so that it was during the last season ·302 under the average of the preceding ten summer quarters. Out of the same population there were *six* instead of the average tale of *seven* deaths. Cholera was epidemic in 1854, and the summer death-rate, then so high (2·423), fell to 1·848 and to 1·896 in the subsequent summer quarters.

49,975 deaths occurred in the districts comprising the chief towns, 41,180 in the districts comprising the small towns and the country districts. The annual rate of mortality in the summer was 2·282 per cent. in the towns, and 1·596 in the country; the average being 2·682 in the towns, and 1·816 in the country.

The density of the population in the town districts was such in 1851 that 384 persons lived on a *hundred* acres, while in the country districts 18 lived on the same ground; so that 14 were living in the same space in towns as was occupied by one in the country. It was shown in the Sixteenth Report* that under our present imperfect sanitary regimen the mortality of the population increases in proportion as the population increases in density; and there must consequently be some relation between these elements.

The matter of which living beings consist is undergoing perpetual changes; it advances from the stages of water, air, salts, earth, and compounds of the other elements, into the vegetable and animal organizations of nature, where it exhibits all the phenomena of life. In

It is gratifying to find that the public mind is now awakened to the importance of rendering the whole population healthy; and that the salutary results of supplying the people with pure water, of removing the dirt from under the dwellings, and of bringing all the known appliances of hygiology into operation, through the agency of a scientific body of medical health officers, are becoming visible.

390,506 persons died in England and Wales during the year 1856. About 324,000 died by diseases and accidents which are at present almost inevitable. And 67,000 persons perished by causes which, if they are skilfully attacked, may it is believed be either mitigated or removed.* Let us pause to consider for a moment what these five figures mean. Each unit represents a life lost. Many had lived to the ordinary limits of age; but thousands in the throng were children, sons, daughters, sisters, brothers, wives, husbands, fathers, mothers, who had not lived out half their days. These lives have been lost; but happily forty-eight thousand men, women, and children of the same classes are now living who would have been dead had the same rate of mortality prevailed in the year 1856 as prevailed in the ten years 1846–55; and the loss of lives is 35,197 less than it was in the previous year. A certain number of these lives has been saved by sanitary measures.

The names of the British soldiers who die abroad are never inscribed on the national registers; so that the deaths in the war are not here brought into account, otherwise the diminution of the deaths in the aggregate population, including the army, would exceed the above numbers to the extent that the mortality was augmented in the years of war and diminished in 1856.

TABLE XIX.—ENGLAND. ANNUAL RATE of MORTALITY per Cent. in TOWN and COUNTRY DISTRICTS in each Quarter of the Years 1846–1856.

In deducing the results given in this Table the population up to 1855 has been increased in the same ratio which was observed between 1841-51. For the year 1853 the increase of population has been obtained by taking the excess of Births over Deaths.

Names of the 125 Districts and 23 Sub-districts comprising the chief towns:—All the Districts of London (36), and Kingston, Richmond, Gravesend, Medway, East and West Maidstone Sub-districts, Canterbury, Thanet, Hastings, Brighton, Portsea Island, Alverstoke (Gosport), Southampton, Winchester Sub-district, Reading, Brentford, Edmonton, St. Clement Sub-district, Headington, Oxford, Northampton, Cambridge, West Ham, Colchester, Bury St. Edmunds, Ipswich, Yarmouth, Norwich, King's Lynn, Melksham, Salisbury, Exeter, Plymouth, East Stonehouse, Stoke Damerel (Devonport), Bedminster Sub-district, Bristol, Clifton, St. Nicholas Gloucester, and St. John the Baptist Gloucester Sub-district, Cheltenham, Hereford City Sub-district, Shrewsbury, Wolstanton, Stoke-upon-Trent, Wolverhampton, Walsall, West Bromwich, Dudley, Stourbridge, Worcester, Birmingham, Aston, Coventry, Leicester, Lincoln Home Sub-district, Radford, Nottingham, Derby, Stockport, East Macclesfield, West Macclesfield, and Sutton Sub-districts, Chester Castle and Chester Cathedral Sub-districts (Great Boughton), Liverpool, West Derby, Wigan, Warrington, Leigh, Bolton, Barton-upon-Irwell, Chorlton, Salford, Manchester, Ashton, Oldham, Rochdale, Haslingden, Burnley, Blackburn, Preston, Todmorden, Huddersfield, Halifax, Bradford, Hunslet, Leeds, Dewsbury, Wakefield, Ecclesall Bierlow, Sheffield, Bosthams, Micklegate, and Walmgate Sub-districts (York), Sculcoates, Hull, St. Oswald and St. Nicholas Sub-districts (Durham), Houghton-le-Spring, Sunderland, South Shields, Gateshead, Newcastle-upon-Tyne, Tynemouth, St. Cuthbert and St. Mary Sub-districts (Carlisle), Merthyr Tydfil, and Llangafelach and Swansea Sub-districts (Swansea).

* See in the Registrar General's 16th Report, pp. xiv—xvi. the grounds of this estimate.

The rate of mortality in the SOUTH EASTERN COUNTIES was generally below the average; but dysentery and scarlatina prevailed and raised the mortality at Woking, Guildford *; typhus and gastric fever were fatal in Gillingham, one of the Medway sub-districts. Scarlatina and low fever were fatal at Thatcham, Newbury, where the deaths exceeded by 37 the deaths in that district in the previous year. In many districts the mortality was low.

The SOUTH MIDLAND COUNTIES were generally healthy; but the mortality rose in the districts of Bishop Stortford, Eton, Wycombe, Buckingham, and North Witchford; ague and fever were busy in some of the fen dwellings; Hatfield and Cranfield were attacked by fevers. There is no inspector of nuisances in the parish of Hatfield.

The EASTERN COUNTIES experienced a reduced rate of mortality; but scarlatina was the scourge of some districts. The Registrar of Radwinter,

* In this and in similar cases the sub-district and the district are designated by the two names.

Saffron Walden, says :—"Malignant scarlatina continues its fatal course " in my district, although steps have been taken to improve the sanitary " state of the cottages."

The Registrar of Clare, Risbridge, "attributes the excess of deaths over " births to the prevalence of typhus and scarlatina in the parish of Pos- " lingford,—which is caused to a great extent by the crowding and want " of ventilation in cottages."

At St. Margaret's, Ipswich, the Registrar reports :—"There were 6 " deaths from typhus, and these in the highest and apparently healthiest " part of the district. I found that the privy of one house, adjoining " those in which the deaths took place, had not been emptied for a long " time, and that vegetable matter and filth had been suffered to accu- " mulate until the whole had become a living mass of putrefaction."

How long are these experiments on the effects of dirt to be continued? When will the town authorities of Suffolk make arrangements for pre-

venting such deplorable accidents, by removing their guano to the fields every day?

In the SOUTH WESTERN DIVISION (Wilts, Dorset, Devon, Cornwall, and Somerset,) the mortality was below the average; but scarlatina prevailed in some districts. It was fatal in Tiverton. Vaccination is neglected, and small-pox has been fatal in several cases. Fourteen cases of small-pox proved fatal in Salisbury. In Looe, Liskeard, seven poor children died of this disease :—"In none of the cases had the children been previously "vaccinated. Many persons delay, if not entirely neglect, to have their "children vaccinated." 32 deaths from scarlatina occurred, mostly in the low, marshy part of St. Andrew, Plymouth. *Effective measures should be adopted, for the sake of the Navy, to render Portsmouth, Plymouth, Sheerness, and the great naval stations healthy.* The mortality in them is till excessively high, and the whole of their sanitary arrangements are defective.

---

the Year 1856. By JAMES GLAISHER, Esq., F.R.S.

alarming extent throughout the quarter." "The medical men," he says, "in the district attribute so much sickness and death to the general system of sewerage now being carried out under the Health of Towns Act, by which old drains are disturbed that have not been opened for generations."

The 5555 deaths in the NORTHERN COUNTIES exceed by only 56 the deaths in the corresponding quarter of 1855. The deaths increased in Durham, and decreased in Cumberland. Scarlatina, which is a highly contagious disease, appears to infest the colliery districts.

A great calamity befel the colliers of Wrexham in WALES:

On 30th September a sudden and unexpected inundation of a coal mine occurred at Bryn Mally colliery, causing the deaths of 14 coal miners who were employed in the mine. By this fatal and melancholy accident 9 widows and 27 children, besides aged relatives, were deprived of their natural means of support.

There is a very marked decrease of the mortality in Merthyr Tydfil. In Carnarvon the mortality increased. In Wales generally the mortality was below the average.

GREAT BRITAIN.

The Registrar-General of Scotland supplies us with the means of completing the Statistics of Great Britain, which contained a population estimated at 22,087,706.

It is questionable whether all the marriages are registered in Scotland; but the registration of births and deaths is enforced by a compulsory clause in the Registration Act. The proportion of registered marriages is much lower in Scotland than in England and Wales; the proportion of registered births is also proportionably lower in Scotland than it is in England and Wales. The mortality in Scotland is also lower by ·129 (=2·050—1·921) than the mortality of England. This is accounted for under existing sanitary arrangements, by the proportion of town population being higher in England and Wales than it is in Scotland.

The marriages, births, and deaths of the people of Ireland are still unregistered, so that the movement of the population in the United Kingdom cannot be given. This defect has been sometimes referred to

TABLE XXIII.—ESTIMATED POPULATION, MARRIAGES, BIRTHS, and DEATHS in Great Britain, 1856.

	Area.		Estimated Population in the middle of the Year 1856.	Marriages.	Persons Married.	Births.	Deaths.
	Acres.	Hectars.					
England and Wales -	37,324,915	15,104,312	19,045,187	159,337	318,674	657,453	390,506
Scotland - - -	20,047,462	8,112,627	3,042,519	20,487	40,974	101,748	58,456
GREAT BRITAIN -	57,372,377	23,216,939	22,087,706	179,824	359,648	759,201	448,962

Note.—The population of England and Wales has been obtained by taking the excess of births over deaths in the 4 quarters ending June 30th in each year; the population of Scotland has been deduced on the assumption that it increased in 1856 at the same rate as it did in each of the 10 years, 1841-51.

PROPORTION per Cent. of MARRIAGES, BIRTHS, and DEATHS to the Population of Great Britain, 1856.

	Areality.		To 100 Persons living.†			
	Acres to a Person.	Hectars to a Person.	Marriages.	Persons Married.	Births.	Deaths.
England and Wales - -	1·96	·79	·837	1·674	3·453	2·050
Scotland - - - - - -	6·59	2·67	·673	1·346	3·344	1·921
GREAT BRITAIN - -	2·60	1·05	·814	1·628	3·437	2·033

† The total area of a country, divided by its population, gives what is here called the "Areality;" it is the average area to each person. The reciprocal gives the "density" of the population or the population to each acre, square mile or other measure.

the fact that the majority of the people of Ireland profess the Roman Catholic religion; but it is evident that the chiefs of the Catholic faith are not now hostile to statistical operations of any kind. The births, deaths, and marriages are registered in all the Catholic states of the continent of Europe; and a valuable series of statistical documents has lately been printed at the press of the Apostolic Chamber at Rome, under the auspices of the Papal Minister of Commerce. The Papal Government took a census in 1853, and has announced its intention to publish henceforward annual returns of births, deaths, and marriages.* Is Ireland in this respect to remain in arrear of all the civilized States of Europe?

Mortality of Great Britain including the Army abroad.

The deaths in the army abroad have not hitherto been taken into account in estimating the mortality, and it thus happened that the national mortality was liable to be under-rated in my Reports in the time of war.

TABLE XXIV *a*.—NUMBER OF DEATHS in the BRITISH ARMY during 1854, 1855, and 1856 (furnished to the Registrar-General by the Adjutant-General by direction of H.R.H. the Commander-in-Chief).

	1854						1855						1856

TABLE XXIV *b*.—DEATHS OF OFFICERS AND MEN in the ARMY ABROAD, and Estima[illegible] Numbers belonging to Great Britain and to England and Wales, in each of the thr[illegible] Years 1854, 1855, and 1856.

YEARS.	Deaths of Officers and Men in the Army Abroad.	Estimated Numbers in Col. 2 belonging to	
		Great Britain.	England and Wales.
1	2	3	4
1854	7,383	4,297	3,496
1855	20,315	11,794	9,619
1856	2,580	1,408	1,222

The number of Deaths in the cols. 3 and 4 were estimated on the assumption that the soldiers abroad belong[illegible] -ed to the different parts of the British Empire in the proportions indicated in the next Table derived from the C[illegible] Report, Occupations, Vol. I., Supplementary Tables, p. ccexiv., vi. *See* Table XXIV *c*.

* Some of the results of the census are lucidly set forth by M. Visschers. See [illegible] his paper, De l'organisation et des travaux du Bureau de Statistique dans les États Roma[illegible]ins. Bulletin de la Commission centrale de Statistique, tome VII. Bruxelles, 1857.

His Royal Highness the Commander-in-Chief has enabled me now to supply the deficiency and to give the corrected mortality of England and Wales for the years 1854–5–6. The mortality of 1854 is slightly affected; the mortality of 1855 is raised from 2·266 to 2·312, by the excessive number of deaths in the Crimea. This mortality exclusively affected the males. The mortality of the army in 1856 produces no effect on the general average.

ENGLAND AND FRANCE.

The French Official Returns for 1855 have recently appeared; and I subjoin a comparative table, in continuation of the more elaborate tables which appeared in my last Report. The marriages in France slightly increased in the year (of the Russian war) 1855; the births decreased; and unfortunately the deaths were above the average, so that the population of France decreased in the two years 1854–5; years of great pressure and of great mortality from privation, cold, cholera, and war.

TABLE XXIV*c*.—ARMY SERVING AT HOME AND ABROAD.

	1851
Officers and Men born in England - - -	67,647
,, ,, Scotland - - -	15,200
,, ,, Ireland - - -	53,109
,, ,, Foreign Parts - -	6,754
Total - - - - - -	142,870

It was inferred also that the 76,444 officers and men abroad in the army in 1851 should be added to the population of the several parts of the United Kingdom, also in the proportions indicated in the above Table. Thus the population of England and Wales at home in 1851 was 17,927,609; add the proportion of the army abroad (36,196) belonging to England and Wales and its population becomes 17,963,805. The estimated population at home in 1856 was 19,045,187, and the population, including its share of the army abroad, was deduced from the following proportion :—

17,927,609 : 17,963,805 :: 19,045,187 : x = 19,083,644

Great Britain was dealt with on the same principles.

TABLE XXIV*d*.—ANNUAL RATE OF MORTALITY per Cent. per Annum, including the Deaths of Soldiers Abroad.

YEARS.	GREAT BRITAIN.	ENGLAND and WALES.	FRANCE.
1854	—	2·366	2·746
1855	2·287	2·312	2·594
1856	2·035	2·055	—

TABLE XXIV*e*.—RETURN showing the AVERAGE STRENGTH of the ARMY ABROAD, in the Years 1854, 1855, and 1856. Furnished to the Registrar-General by desire of H.R.H. the Commander-in-Chief.

	1854		1855		1856	
	Officers.	Non-commissioned Officers and Men.	Officers.	Non-commissioned Officers and Men.	Officers.	Non-commissioned Officers and Men.
Cavalry - - - - -	192	4,092	245	5,676	137	3,614
Infantry - - - - -	2,583	80,864	3,008	95,440	2,682	85,257
Artillery - - - - -	214	5,273	307	9,067	240	7,694
Engineers - - - -	121	1,344	130	1,388	106	1,434
Total - - -	3,109	91,473	3,685	111,571	3,165	97,999

The returns of France for the year 1856, though incomplete, happily presented a more cheering aspect; and M. Legoyt confidently predicts as the result of the whole returns an excess of births over deaths.

The marriage rate is lower in France than it is in Great Britain; the difference in the birth rates is enormously in favour of Great Britain, where in 1855 it was 3·342, while it was 2·491 in France, so that to every 90 persons living, 3 children were born in Great Britain and 2 children were born in France. The death rate, including the armies abroad, was 2·287 in Great Britain and 2·594 in France. In both countries the mortality in 1854, the year of cholera, was greater than the mortality in the year 1855, when the sanitary arrangements of the armies were most defective.

Births and Deaths of English Subjects at Sea.

The Registration Act directs the captains of British vessels to register the births and deaths on board, and to send certificates to the Registrar-General. No penalty is appended, and it will be evident from the sub-

Table XXV.—England and France. Estimated Population, Registered Marriages, Births, and Deaths, in each of the Years 1853, 1854, and 1855.

	England and Wales.			France.		
	1853	1854	1855	1853	1854	1855
Estimated Population -	18,403,318	18,618,760	18,786,914	36,225,000	36,155,682	36,118,408
Marriages - - - -	164,520	159,727	152,113	280,609	270,906	283,846
Births - - - -	612,391	634,405	635,043	936,967	923,461	899,539
Deaths - - - -	421,097	437,905	425,703	795,607	902,779	936,833

The Population of England and Wales for 1853, 1854, and 1855 has been deduced by taking the excess of births over deaths since 1851, when the population was enumerated. The Population of France for 1853 is obtained from the "Statistique de la France, deuxième série. Tome III. (1re partie)," and for 1854 and 1855 by making a deduction for the decrease of births as compared with deaths in those years. The Census is not taken on one day in France, as it is in England, and the date of the French Census is not stated.

Proportion of Marriages, Births, and Deaths to the Population of England and Wales, and in France, 1853–5.

	England and Wales.			France.		
	1853	1854	1855	1853	1854	1855
Marriages - - - -	·894	·858	·810	·775	·749	·786
Persons married - - -	1·788	1·716	1·620	1·550	1·498	1·572
Births - - - -	3·328	3·407	3·380	2·587	2·554	2·491
Deaths - - - -	2·288	2·352	2·266	2·196	2·746	2·594

The rate of mortality of females during the year 1853 was, in England 2·201, and in France 2·189 per cent. In 1854 the female rate of mortality in England was 2·373, and in France 2·721 per cent. In 1855 the female rate of mortality in England was 2·187, and in France 2·483 per cent.

Table XXVI.—Number of Births and Deaths of English Subjects in British Vessels at Sea, reported by the Captains or Commanding Officers of Vessels, and entered in the "Marine Register," pursuant to Sections 21 and 26 of the Registration Act.

	Total.	Males.	Females.
From 1st July 1837 to 31st Dec. 1856:—			
Births at Sea - - - -	649	330	319
Deaths at Sea - - - -	3469	3199	270
Whereof were reported during the year 1856:—			
Births at Sea - - - -	72	37	35
Deaths at Sea - - - -	302	274	28

joined table, that the Act has been imperfectly complied with. The births which appear in the marine register amounted to 649 at the end of the year 1856, the deaths to 3469. In that year the registered births at sea amounted to 72, and the registered deaths to 302.

The registers of 165 marriages before Her Majesty's Consuls abroad were received during the year 1856.

Certified Places of Meeting for Public Worship.

In pursuance of the Acts of Parliament which provide for the certifying and registering of Places of Religious Worship, 7713 chapels and places

* *The Districts are collections of contiguous Parishes or Places, combined for purposes connected with the Registration of Births, &c. in certain districts; and are generally identical with the Poor Law Unions of the same names. The Districts are arranged according to their local position under the Registration Counties.*

* The *Registration Counties* consist of groups of entire Registration Districts; which Districts are, in general, identical wit
Unions. As the principle adopted has been to place a District or Union which extends into more than one County with the
ther the principal town or the greater part of the population is located, the limits of the Registration Counties differ more
ndaries of the Counties proper.

† *ne of the births*—especially of illegitimate children in London and large towns—escape registration.

MARRIAGES, BIRTHS, and DEATHS registered in the Year 1856—*continued.*

* The *Districts* are collections of contiguous Parishes or Places combined for purposes connected with the Registration of Births, Deaths, and Marriages; and are generally identical with the Poor Law Unions of the same names. The Districts, 626 in number, are arranged according to their local position under the Registration Counties.

† For a table of the Deaths in the principal *Public Institutions* situated in the Districts of London see pages 82-4.

Note.—*Wherever the* minus sign is prefixed to the number in the column headed "Excess of Births over Deaths," it denotes *that the Births in the District*, instead of exceeding the Deaths were, in fact, less than the Deaths to the extent stated.

h-districts are sub-divisions of the Districts, and comprise the Parishes or Places in which the Births and Deaths are
istrars severally appointed for that purpose.
notes that the Sub-district contains within its limits a Workhouse belonging to the District or Union; ‡ indicates
belonging to *another* District or Union is included.
inus sign (−) is prefixed to the numbers given in the Column headed "Excess of Births over Deaths," it denotes
the Sub-district, instead of exceeding the Deaths, were, in fact, *less than the Deaths* to the extent stated.
eaths over Births in several of the Sub-districts of London is attributable to the mortality in Hospitals.
of Deaths in the Hospitals, Workhouses, and other principal Public Institutions in London, see pp. 62-4.

ENGLAND AND WALES.—SUPPLEMENTARY TABLE of the

[The principles upon which the Causes of Death are tabled have been explained in previous Annual Reports. It will be sufficient to state now that all the Diseases, either having a distinct character, or fatal to any considerable number of persons, are classified under 107 heads; some of which, however, include groups of very distinct diseases,—such as are fatal to only a *few persons*, or *diseases* which are often confounded with other diseases. The rule has been to refer the distinct diseases to heads under which the cases were so numerous, that the additional numbers would not interfere with the calculated proportions. Thus *mumps* was the cause of 94 deaths (Males and Females) in the year 1856, and scarlatina of 14,066. The mortality of

s of DEATH at different Periods of Life, in the Year 1856.

na, deduced by dividing the deaths from that disease, *plus* 94, by the total population of d, will be found to differ little from the mortality from scarlatina alone. Where it is , partial correction however can now be made by means of the following Supplementary containing many of the deaths from distinct diseases, such as mumps, glanders, epistaxis, lry gangrene, polypus, rickets, bronchocele, &c. &c., and deaths from other forms of , such as softening of the brain (necrencephalus), which are returned in many cases other heads, as paralysis, &c.

e Tables are an extension of the Tables of Causes of Death in England, pp. 120–123.]

Note.—In calculating the average annual rate of mortality from All Causes in London a correction has been mad
tributing the deaths in Hospitals proportionally over every district.

* The Holborn and West London Districts are combined in the calculations of mortality in the ten years 1841-50 in co
of a portion of West London having been added to the Holborn District in 1845. For similar reasons a few other distri
kingdom will be found grouped together so far as regards the average rate of mortality during the same ten years.

† *Excluding* Fort Pitt and Fort Clarence, the annual mortality in the Medway District was 24 to every 1,000 persons l

1851, Average Annual Rate of Mortality from All Causes in the Ten Years 1841–50, and ıths from several Causes in the Year 1856, in the Districts of England—*continued.*

LETTER from Dr. FARR to the REGISTRAR GENERAL on the CAUSES of DEATH in ENGLAND and WALES during the Year 1856, drawing attention to the CORONERS' RETURNS of VIOLENT DEATHS, and suggesting IMPROVEMENTS in them	183–205
REPORT to the REGISTRAR GENERAL on the INTERNATIONAL STATISTICAL CONGRESS held at VIENNA in 1857, by Dr. FARR	206–222

Letter to the Registrar General on the Causes of Death in England and Wales, by William Farr, Esq., M.D., F.R.S.

Year 1856.

Sir,

This year, it has been shown in your Report, is remarkable in the annals of England for its low rate of mortality. You have in previous years had more than once to dwell on the ravages of epidemics, and to register the losses of unusual numbers of the population. The process is happily reversed in the year 1856.

I have the honour to submit to you the result of the inquiries into the deaths of the year, and to state their causes, and to show which of them have prevailed with mitigated severity.

The year differs from the year 1854 in the diminished number of deaths by cholera and other zymotic diseases. It differs from the year 1855 in the diminished number of deaths by influenza, catarrh, and inflammations of the lungs.

The people were neither destroyed by the severities of the winter nor by the pestilences of summer. The improvement will, we may hope, be the harbinger of still healthier years, under better sanitary arrangements.

The meteorology of Greenwich does not exactly represent the meteorology of the whole inhabited surface of England and Wales, but it enables us to compare the meteorology of successive years. For, it may be safely assumed, that when the mean temperature is above the average at Greenwich it is also above the average in the other parts of England and Wales.

The air moved faster at Greenwich in the year than it did in the three previous years. It passed over the Observatory at the rate of 102 miles a day, the average pace of the wind being 99 miles a day. It is worthy of remark, that though the wind is proverbially "swift" its average pace of 4¼ miles an hour is little more than the ordinary pace of a good walker. The average annual pace is 4·125 miles; the highest pace (1850) is 4·530 miles, the lowest annual pace (1853) 3·548 miles an hour. The pace in 1856 was at the rate of 4·244, nearly 4¼ miles an hour.

The movement of the wind is of great importance, for it carries off the organic particles that float over human habitations. It varies considerably in different parts, as it is necessarily affected by the form, the elevation, and the aspect of the ground.

The rain-fall was 21·9 inches, which is slightly below the average of the eight years. The rain-fall was 34·4 inches in 1852 and 18·7 inches in the year 1854 when cholera was epidemic.

The dew point was 43·4°; the difference between that point and the mean temperature was 5·7°, and the mean temperature was 49·1, which is near the average. In the previous year the mean temperature was 46·9°. The winter of the year 1856 was very mild; the temperature of the spring quarter was above the average; the mean temperature of summer and autumn presented little deviation from the average.

The meteorological elements of the year were not calculated to disturb the ordinary rates of mortality.

For a summary of the meteorology of these islands, I beg to refer to the valuable table which was furnished by Mr. Glaisher (see pp. xxxii–xxxiii.)

The average price of wheat attained its maximum (74*s.* 8*d.*) in 1855; the price in 1856 began to decline, but it remained high, 69*s.* 2*d.* Potatoes

were comparatively cheap. At the wholesale waterside London market they sold at the rate of 86*s.* a ton, or of 26 lbs. for a shilling. In 1853 only 17 lbs. of potatoes could be purchased wholesale for a shilling. The comparative abundance of potatoes in 1856 to some extent counteracted the effects of the high price of wheat, and as potatoes are antiscorbutic exercised in other ways a salutary influence.

The price of beef rose progressively from 4½*d.* a pound in 1852 to 5⅝*d.* in 1855; of mutton, from 4⅞*d.* to 5⅝*d.* a pound in the same years.

Wages apparently rose in the same years, so that the condition of many of the labouring classes was little less substantially good than it is in years when the prices of wheat and meat are moderate.

TABLE (1).—Causes of Death registered in England in each of the Eight Years 1849—1856.

	Causes of Death.	1849	1850	1851	1852	1853	1854	1855	1856
	All Causes	440,839	368,995	395,396	407,135	421,097	437,905	425,703	390,506
	Specified Causes	432,710	361,556	388,675	400,439	414,197	432,242	419,798	385,840

I. Causes of Death.

Of the 390,506 deaths in the year the causes were not specified at all in 4666 instances, and only specified vaguely in 3474 cases which are tabulated simply as sudden deaths, no further definite information having been elicited by the inquiries, chiefly of coroners' juries.

(1.) *Zymotic diseases:—Zymotici.*

78,047 persons died of zymotic diseases; which proved fatal to 4·148, or rather more than four in 1000 of the population. *Twenty* per cent. of the deaths were by zymotic diseases.

TABLE (1).—Causes of Death registered in England in each of the Eight Years 1849—1856—*continued.*

	Causes of Death.	1849	1850	1851	1852	1853	1854	1855	1856

	Causes not specified	8,129	7,459	6,721	6,696	6,900	5,063	5,905	4,666

The mortality in the last three years by zymotic diseases decreased progressively from 6·180 to 4·567, and to 4·148 in 1000 of the population. The decrease is due in great part to the diminished rates of mortality from cholera and its attendant diarrhœa; thus out of every *million* of the population 2185 died of cholera and diarrhœa in 1854, and only 774 in 1856; the decrease referable to these two heads is 1411, leaving 621 to be accounted for by the decrease in the mortality of small-pox, measles,

TABLE (2).—ENGLAND. CAUSES OF DEATH. To 1,000,000 PERSONS LIVING, the DEATHS from each Class of Causes, and from each Cause, in the Years 1854, 1855, and 1856.

	CAUSES OF DEATH.	Deaths to 1,000,000 *Persons living.* 1854	1855	1856
	ALL CAUSES	23,520	22,659	20,504

	106 Other Violence	27	22	21

The Table may be read thus: In 1856 to every 1,000,000 Persons living there were 20,504 deaths from All Causes (rather more *than 20 in 1000)*; 121 deaths from small-pox; 379 from measles; 732 from scarlatina, and so on.

scarlatina, hooping-cough, thrush, dysentery, influenza, scurvy or purpura, ague, remittent and infantile fever, typhus, and syphilis.

Croup and rheumatic fever were unusually fatal. Metria (childbirth fever), which is closely allied to erysipelas, was also more fatal than it had been in some previous years.

The mortality by seven of the zymotic diseases within the last fifteen years is shown in the annexed Table.

The new series of Tables (pp. 148–159.) exhibits the number of deaths in each district from the principal zymotic diseases, from consumption, diseases of the respiratory organs, and from violence.

(2.) *Constitutional diseases:—Cachectici.*

82,856 persons died of this class of diseases; which contributed 4·402 to the annual rate of mortality out of 1000 living. 21 per cent. of the deaths were due to constitutional diseases.

This class consists of two great groups. Of the group of diseases of variable seat 19,024 persons died, comprising 8213 who died of dropsy and 5859 of cancer in its various forms. The tubercular diseases were fatal to 63,832 persons, comprising 2831 who died of scrofula, 4752 of tabes mesenterica, 7299 of hydrocephalus, and 48,950 of consumption. The mortality by consumption was at the rate of 2·6 in 1000 on the population; 12·7 per cent. of the deaths were by consumption; while in 1854 11·9 of the deaths were from this disease. The deaths by consumption to 1000 living were in an inverse proportion; or 2·601 in 1856 and 2·791 in 1854.

This is in accordance with the principle which was laid down in the Appendix to the First Report: when the deaths by consumption constitute a large *proportion* of the total deaths, the mortality from all causes, and often from consumption itself, is low, and conversely. Through ignorance of this principle, it has been assumed that consumption is more fatal in England than it is in the other countries of Europe.

Constitutional diseases vary less than zymotic diseases in different times and places, hence in unhealthy years and places the deaths by zymotic diseases increase more than the deaths by constitutional diseases, which appear to be comparatively less, although they are absolutely more numerous. Thus in the two years 1849 and 1856 the deaths by zymotic diseases were 137,770 and 78,047, the deaths by constitutional diseases were 84,685 and 82,856, and during the eight years constitutional diseases were every year nearly equally fatal.

TABLE (3.)—ENGLAND AND WALES. NUMBER of DEATHS and ANNUAL RATE of MORTALITY from Seven ZYMOTIC DISEASES, and from ALL CAUSES, in groups of Five Years.

DISEASES.	DEATHS. In the 5 Years			AVERAGE ANNUAL MORTALITY to 100,000 Persons living. In the 5 Years		
	1838 to 1842.	1847 to 1851.	1852 to 1856.	1838 to 1842.	1847 to 1851.	1852 to 1856.

	105 Wounds	1,379	1,470	1,563
	106 Other Violence	1,150	987	1,043

The Table may be read thus:—To 1,000,000 deaths from All Causes in 1856 there were *5,902* deaths from small-pox; 18,464 from *measles; 36,699 from* scarlatina, and so on. By placing a decimal point before the three figures on the right hand, the proportion will *be shown to 1,000 deaths*; thus, there were 5·902 deaths from small-pox to every 1,000 deaths from All Causes.

34 to 77, that in this character it approaches the zymotic diseases, and it will be recollected that a peculiar dancing mania (allied to chorea) is a recorded epidemic of the middle ages.

13,672 deaths were referred to diseases of the organs of circulation, including 338 by aneurism and 278 by angina pectoris, and the mortality which they occasioned was at the rate of less than 1 (it was ·726) in 1000 living. Of 100 deaths 3·5 were by these diseases.

52,908 persons died by *diseases* of the *respiratory organs*, including 21,528 by bronchitis and 22,653 by pneumonia. These diseases, and all others of the class, were less fatal than they were in the previous year.

Congestion of the lungs and pulmonary apoplexy were fatal to 594 males and 491 females; and of sunstroke 30 males and 5 females died. The number of deaths from sunstroke in the year 1855 was 9 males and 5 females.

The mortality by this *class* of diseases was at the rate of 2·8 in 1000. Of 100 deaths they constituted 14.

TABLE (5)—ENGLAND. CAUSES OF DEATH in the Year 1856, arranged in the order of Mortality.

CAUSES OF DEATH.	Number of Deaths registered in the Year 1856.	*Proportional Number* from each Cause to 1,000,000 Deaths from All Causes.*	CAUSES OF DEATH.	Number of Deaths registered in the Year 1856.	*Proportional Number* from each Cause to 1,000,000 Deaths from All Causes.*

* The causes of 4,666 deaths were not specified; in calculating the proportional numbers they have been distributed pro rata over all the causes in the Table.

The diseases of the digestive organs were fatal to 22,620 persons; including 3660 children who died in teething, 3234 persons who died of enteritis, 1310 of peritonitis, 760 of ascites; many persons died of various kinds of obstruction of the intestinal canal, namely, 848 of hernia, 1190 of ileus, 280 of intussusception, and 242 of stricture. Of the 848 deaths by hernia, 71 were stated to be by inguinal, 14 by scrotal, 113 by femoral, and 52 by umbilical hernia, besides 11 deaths (10 of children) by congenital hernia; in 598 cases the kind of hernia was not distinguished. Of the 1190 deaths classed under ileus, 845 were returned as obstruction of the bowels. Of 254 persons who died of worms, 176 were children under 5 years of age. 10 persons died of hydatids of the liver.

Disease of the pancreas was returned as the cause of 12 deaths; of the spleen as the cause of 51 deaths. The liver is much more liable to disease; and including hepatitis, jaundice, and its other maladies, 6498 fatal diseases of this organ were registered.

The mortality by all the diseases of the digestive organs was at the rate of 1·2 in 1,000 of the population; and of 100 deaths 6 were caused by the diseases of this class.

The other local diseases are the causes of comparatively few deaths. 4327 persons died of diseases of the urinary organs; namely, 269 by nephritis, 954 by nephria (or Bright's disease), 433 by diabetes, 233 by stone, 270 by cystitis. 177 deaths by stricture of the urethra, properly belong to gonorrhœa, of which it is sometimes the sequel. 1908 deaths are the result of bladder, kidney, and prostate disease of a kind not specified. Diabetes is a well-defined disease, and it has fluctuated very little in eight years; the average annual number of deaths by it was 422, the lowest number was 402 (in 1852), the highest number was 448 (in 1855), the year of extreme cold.

2917 deaths were the results of diseases of the organs of generation; the mortality by them was at the rate of ·16 in 1000, and they caused 8 in 1000 deaths. 1067 mothers died of *metria* or puerperal fever, which is in the zymotic class; and 1821 died of other diseases incidental to the state of childbearing; of the latter diseases flooding was the most fatal; 315 mothers bled to death. The fatality from this disease increases rapidly with the advance of age. Thus 34 women died of flooding of the age 15–25, 121 of the age 25–35, and 150 of the age 35–45; and at the

In calculating the annual mortality a correction has been made for increase of population. The annual rate of increase (females aged 15–55) 1841-51, was ·01200, and it has been assumed that the number of women bearing children increased at a uniform rate at each of the ages in the Table. A further correction has been made as follows: At the age 15-55 there were 1,900 deaths from childbirth and 1079 from metria in 1855; and 1,921 from childbirth and 1067 from metria in 1856: excluding deaths from metria, only 964 deaths from childbirth in 1855, and 954 in 1856, were designated under any of the definite headings of the class; and the deaths under each of the above headings are assumed to have been understated in the same ratio, and raised accordingly in calculating the mortality. *A similar* correction has been made for each age in the Table.

same ages 3, 40, and 38 women died (probably from hæmorrhage), the result of the insertion of the placenta over the aperture of the uterus (placenta prævia). Puerperal mania follows another law. Puerperal convulsions are most fatal to young mothers. The dangers to be guarded against in childbirth thus vary with the age of the woman. The relative extent of the danger from several causes is shown approximatively in Table (6).

The danger of rupture of the uterus increases rapidly; the danger of flooding increases less rapidly; the danger of death by puerperal convulsions is greatest in early life; and the liability to puerperal mania decreases as age advances.

The mortality in childbirth continues to decrease in England and Wales; the birth of every 10,000 living children was the death of *sixty* mothers in 1847, and of *forty-four* in 1856; thus *sixteen* mothers are now saved on every 10,000 children born. This happy result is partly due to the progress of science; and may well encourage its cultivators to redouble their exertions.

2260 persons died of diseases of the organs of locomotion, exclusive of the deaths under scrofula, which often affects the bones. The rate of mortality was less than one in 1000; it was little more than 1 in 10,000. Nearly 6 in 1000 deaths belong to the class.

672 persons died of diseases of the integumentary system; not *one* in 10,000, but only 36 in 1,000,000 of the population. Less than 2 deaths in 1000 were from these diseases. Yet they included 253 deaths from carbuncle, which has within recent years prevailed epidemically, and may now be justly referred to the zymotic class. The learned Professor of Medicine in Edinburgh gives cases which appear to show, that, under certain circumstances, carbuncle is contagious.* Carbuncle and boil are

not separated in the returns; and in this extended sense the disease is rarely fatal; yet the number of deaths from 81 in 1849 rose to 300 in 1854, and subsequently fell to 253. Singularly enough the deaths from phlegmon decreased.

(4.) *Diseases of Growth, Nutrition, and Decay, or Developmental Diseases.*

1000 children died of malformations of various kinds; and they were nearly all taken from their parents in the first five years of a life which they could never enjoy. Many children are born prematurely; others are born without evident defects of form, but are feeble, and are so defective in vital energy that they die shortly after birth; adults also, before they attain old age, fall into a state of debility without discoverable disease. All these cases, classed as premature birth and debility, amount to 17,997, or nearly 5 per cent. of the total deaths. The mortality from these causes was at the rate of little less than 1 death to 1000 persons living. Atrophy, or wasting away, was returned, in the absence of any specific malady, as the cause of 13,712 deaths, or of 3·6 per cent. of the total deaths. Seven out of 10,000 of the population died of atrophy.

Old age was the assigned cause of 23,931 deaths. The proportion would be higher were it not that the number of old people living in England in proportion to the population is below the average standard, chiefly in consequence of the excess of births over deaths; yet it is a remarkable fact, that after corrections have been made for this disturbance, so small a number of the people should attain old age.

(5.) *Violent Deaths.*

14,912 deaths were the evident effects of external causes, and belong to the violent order of unnatural deaths. 237 deaths were referred directly to intemperance; 451 to delirium tremens. The mortality under both heads has decreased during the last three years; so has the number of deaths (69) described as the result of the privation of food. 704 children died, it is stated, from the want of breast milk; 32 from neglect. The effects of alcohol, and the effects of the privation of proper food at different ages, are often indirect, and are not easily recognizable, as they are liable to be confounded with the effects of other causes. Cold, which was the cause of 195 deaths in the severe winter of 1855, was fatal to 86 persons in the year 1856. The number of deaths by burns and scalds fell from 3177 to 2919; the decrease was 258, while the decrease in the deaths by cold was only 109. This bears out the observation in my previous letter, that the excess of deaths by burns in 1855 was the consequence of the increase of fires, and of the nearer approach of people to the burning fuel. 432 persons were poisoned in the year, or 52 persons in excess of the numbers poisoned in the previous year. The beneficial effect of the Act of Parliament appears to have been temporary.

1314 persons died by hanging and suffocation; the deaths under this head are nearly stationary. 2681 deaths from drowning imply an increase of the mortality by this cause; the deaths at sea are not included in the registers, so that the number of deaths by drowning among our population is understated.

5433 deaths from fractures and contusions imply a great number of injuries to great numbers of people, and they could only occur in a country where mechanical forces of every kind were in extensive action. The number of deaths from these causes, and from other violence not specified, was 5010 in the year 1849, 6275 in the year 1853, and 5835 in the year 1856. Thus the deaths by mechanical violence for some years increased rapidly, and they are now gradually declining. The deaths by wounds were 603.

The rate of mortality by this class of violent causes was nearly 8 in 10,000 living, and nearly 4 in 100 deaths were deaths by violence.

II. Diseases of the Sexes. (Tables, pp. 120–147.)

Few diseases are equally fatal to males and females. The difference in the organs of the body is considerable; the tissues are of different quality; all the functions are modified in boys and girls, in men and women; and by their occupations they are exposed in different degrees to the causes of disease.

In reading the tables it will be borne in mind that there are 1000 males to 1035 females in the population.

Diseases of males.—Zymotic diseases are generally more fatal to *males* than to females; thus 1248 males and 1029 females died of small-pox; 137 males and 90 females of purpura and scurvy, men being more frequently than women *deprived* of vegetables. 599 males and 477 females died of rheumatic fever; 4 males and 1 female of hydrophobia, men being more exposed to bites; 61 males and 33 females died of mumps; 7 males and 1 female of glanders.

Among the deaths by constitutional diseases are 825 deaths of males and 634 of females by abscess; 60 of males and 13 of females by fistula; 221 of males and 39 of females by gout, as men generally eat and drink more inordinately than women. Scrofula and tabes mesenterica are most fatal to males; and so is hydrocephalus, of which 4161 males and 3138 females died; the brain of the boy being more liable to disorder than the brain of the girl.

Of the local diseases males die in greater numbers than females (78,152 males, and 71,759 females).

The brain diseases, cephalitis and convulsions, are both most fatal to males; so is delirium tremens, of which 390 males and 61 females died, the excess being referable to the same cause as the deaths of 171 males and 66 females, ascribed directly to intemperance. Of softening of the brain, 475 men and 289 women died. 79 males died of tetanus and 41 females; but it is probable that tetanus was generally induced by wounds and injuries, and that women, the injuries being equal, are more tetanical than men.

Heart disease kills more women than men; but of angina pectoris, 156 men and 122 women died; and aneurism was fatal to 84 women and to 254 men, who often make violent exertions which rupture the large arteries, when these are once rendered fragile by deposits.

Inflammatory affections of the respiratory organs are more fatal to males (28,400) than to females (24,508).

Teething was returned as the cause of the deaths of 1979 males and of 1681 females; it follows the same law as convulsions. So does laryngismus, of which 147 males and 78 females died.

The excess of the deaths of males by disease of liver is probably the result of intemperance. Inguinal hernia is most fatal to males; femoral and umbilical hernia to females.

Diseases of the urinary organs are the causes of the deaths of 3161 males and of 1166 females. The excess of these diseases among males is in the first place due to the difference of organization; the urethra is wider and shorter, the bladder larger in the woman than in the man, hence calculi are passed, which in the form of stone killed 212 men and only 21 women. The inflammatory and other affections of the kidneys are often indirectly caused by calculi, and sometimes by stricture, itself the result of gonorrhœal infection. Prostatic disease, of which 313 men died, is peculiar to males. The urinary secretion also probably differs in the two sexes; for diabetes was fatal to 274 men and to 159 women.

Only 40 deaths of males are ascribed to diseases of the organs of generation, exclusive of syphilis and its results.

Caries and necrosis, amongst the diseases of the bones, are, like scrofula, most fatal to males.

Malformations from arrested development are generally most frequent in males; such is the case as regards cyanosis (males 209, females 132); anus imperforatus (m. 62, f. 22); and cleft palate (m. 32, f. 22); of spina bifida, however, 153 females and only 146 males died.

Of premature births and debility, the deaths of males are 1929 in excess of the 8034 deaths of females. The intrauterine life of the males is the most hazardous. *Sudden death* from diseases undetermined is more frequent in men than in women.

Males, are in every way except one, the most exposed to die violent deaths, whether it be by war, by suicide, by accident, by negligence, or by public execution.

Diseases of females.—Of the zymotic diseases, hooping-cough is the most fatal to females; 4007 males and 5218 females died of the disease. Influenza is also most fatal to females; chiefly, perhaps, because the number of females living at advanced age is in excess of the number of males. Metria is a disease exclusively incidental to child-bearing women.

Of the constitutional diseases,—dropsy, from disease of the kidneys, probably, or from diseased heart—is most fatal to women; 4715 women and 3498 men died of dropsy. Of cancer, attacking chiefly the breast and the uterus, 4069 women and 1790 men died.

Consumption is much more fatal to women than to men; of this destructive disease 23,016 males and 25,934 females died. The disparity in the rates of mortality is most striking at the ages from 15 to 55, as will be immediately apparent on comparing the figures.

TABLE (9).—DEATHS FROM CONSUMPTION.

Ages - - -	10—	15—	25—	35—	45—	55—
Men - - -	725	5437	5335	4143	2338	1660

95 and upwards	535	1,014	1	3	·19	·39	·20

NOTE.—The Table may be read thus:—In the 7 years 1848-54 the average annual rate of mortality from *Phthisis*, to 1,000 living, of males aged 15 and under 25 years, was 3·28; of females 4·00; being an excess in the *female rate of* mortality of ·72. At the ages 0—5, 45—55, &c. the male rate is in excess of the female rate, as is *indicated* by the minus sign (—) prefixed.

stays, to the in-door life of women, to peculiarities of organization, and to other causes, it is not easy to calculate. But it is evident physiologically that air is the pabulum of life, and that the effects of a tight cord round the neck and of tight lacing round the waist, only differ in degree, in the time of their manifestation, and in some of their symptoms; for the strangulations are both fatal. To wear tight-laced stays is in many cases to wither, to waste away, to die; and is perhaps the natural chastisement of the folly which inflicts this Chinese deformity, natural only to wasps and other insects, on the grace and beauty of the human figure.

The causes of the fatality of this disease require further investigation.

Among the brain diseases, chorea was fatal to 45 females and 14 males. Insanity is often complicated with other diseases, which are returned as the causes of death; but a majority of the deaths ascribed to insanity occur among females. 32 women are returned as dying of hysteria; 9 of fright.

Heart disease is more fatal to women than to men; so are gastritis, peritonitis, ulceration, and stricture of the intestines and gallstone. Of ascites 276 men and 484 women died.

Of ovarian dropsy, a disease peculiar to women, 211 died; and 57 women died of paramenia. While 40 men died, 788 women died of diseases vaguely returned, and classed consequently as diseases of the organs of generation.

Of the malformations, spina bifida alone appears to be most fatal to females.

While other violent deaths were chiefly fatal to men, burns and scalds are nearly equally fatal to the two sexes.

III. Diseases of Infants under One Year of Age.

The structure of the infant frame is immediately tested after his birth; and sometimes from injuries in birth, sometimes from physical defects, and sometimes from his imperfect chemical affinities, the process of life ceases. The infant dies. His elements are given to the grave. All his faculties are imperfectly developed, and he can give no articulate information. The characters of diseases themselves are often imperfectly marked; and his means of defence against injury lie chiefly in his mother's love, which is generally adequate to its office. The fate of the infant which the mother abandons, not in the street, but in the house, when she works in the field or the factory, or when she indulges in any vice, or neglects cleanliness, is early death. All the poisonous emanations from the drains and cesspools destroy children, created to live in pure air. Hence, with few direct infanticides, the deaths of 94,407 infants under one year of age are registered in England and Wales, in the year; 18,808 infants died of zymotic diseases, of which diarrhœa is the most fatal. 7893 infants died of diarrhœa. To thrush the deaths of 1034 infants are ascribed. Whooping-cough was fatal to 3708 infants. The other zymotic diseases were more or less fatal. Syphilis, either congenital or from immediate infection, was the registered cause of 579 deaths.

Scrofula, tabes, and hydrocephalus are fatal to many infants; cephalitis was fatal to more than 500 infants; convulsions to 19,718.

Bronchitis and pneumonia are not easily distinguished in infants; in the aggregate the deaths from these causes amounted to 12,738. Like convulsions, they are much more fatal in males than in females.

The malformations generally terminate fatally in the first year of life.

The want of breast-milk was returned as the cause of 695 deaths. A few infants die of burns and scalds; but suffocation in bed, from overlaying or from the shutting out of the air from the child, is the most frequent violent death of infants.

IV. Coroners' Returns of Violent Deaths.

Life is still a mystery, and it ceases sometimes inexplicably; yet many causes of death are evident. It was known from the beginning that man can kill man; and the cause of homicide is not only discoverable, but, to some extent, controllable. The culpable man can be punished, with a view to prevent the repetition of the fatal act by himself or by others. In England a special officer has been elected by the people, from the earliest times, to visit the body of every person slain or wounded, and to inquire into the circumstances of each case. The mere fact that the death was sudden, or that the body was found in water, if the coroner was called upon, rendered inquiry imperative; and it is accordingly enjoined in the statute (4 Edward I.) regulating the coroner's office.

The progress of science has created new forces, often fatal, and has produced new substances, of which our forefathers had no knowledge. Machinery is organized on a large scale, so that the lives of numbers of men are liable to be destroyed, not by malicious intent, but by the negligence of other men who have their lives in charge. Thus, great numbers die by railway accidents; many perish in mining operations; children are suffocated in bed or are burnt by "their clothes taking fire." Poisoning is not mentioned in the act of Edward; but poisoning is now, unhappily, a common cause of death. Poisons are the most insidious instruments which assassins can employ, and they were evidently little known in England before the Reformation; yet the first English legislators directed inquests to be held on the body dying suddenly, because death might possibly even then be the result of secret violence. Persons slain generally die suddenly; hence, it was made the rule to hold inquests in cases of sudden death. Such was the wise provision of the law.

A man is killed; the coroner receives notice, and summons a certain number of men to inquire, under his direction, into the causes of the death, and to pronounce, after hearing the evidence, a preliminary verdict of acquittal or of guilt. The utility of the inquest is evident. It recognized, in barbarous times, the value of human life. No man could be slain without inquiry. It was a simple means of discovering the guilty, and it brought home blame to the negligent; at the same time the innocent were protected against false imprisonment, for "guilty" was not the verdict of a despot, but of a jury of twelve or more ordinary men who fairly represented public opinion. The verdict threw a shield around the innocent, who, without the inquiry, might have been falsely suspected: it left no excuse for private vengeance: and, undoubtedly, the coroner and the jury deterred many evil natures from the commission of crimes which they would have perpetrated had not the dread of the inquest interposed. Lives were thus saved, and every man enjoyed a sense of security which the commission of murders with impunity would have destroyed in the great mass of the population. For, without the inquest, assassination would be the death of many men—the dread of all.

The coroner's inquest is entirely a popular institution. The county coroner is elected by the freeholders; and it is one of the great advantages of the inquest that it engages the great body of the people in the administration of justice; public opinion is thus never in favour of a man whom a jury has pronounced guilty. Assassins and *bravoes* have been shielded from discovery by people in foreign lands who have never served on juries. Through inquests the great body of the English people have been taught also, to some extent, the action of general causes, such as nuisances, in destroying life.

Coroners are elected for counties, and in some cases, for sub-divisions of those counties; boroughs and some districts have special coroners. England and Wales have, apparently, 324 coroners, some of whom appoint *deputies*; they held, according to Mr. Redgrave's returns, inquests on

21,801* bodies in the year 1856. The total charges amounted to 67,000*l.*, averaging 3*l.* 1*s.* 6*d.* for each death into which inquiry was made. The charges included the coroner's fees (1*l.* 6*s.* 8*d.* on each inquest), and mileage (9*d.* a mile, reckoning only one way, from his usual place of abode to the body); medical fees for evidence, autopsies, and analyses; witnesses' expenses, constables' allowances, and payments to jurymen, and for rooms.

The findings of the juries are classed under the following heads by Mr. Redgrave:

Injuries from Causes unknown	424		
Homicide	482	Including—Murder	205
		Manslaughter	271
		Justifiable Homicide	6
Suicide	1,314		
Accidental Deaths	9,716		
Ascertained Violent Deaths	11,936		
Natural Deaths	7,102		
Found dead	3,183		
Total Dead bodies on which inquests were held	22,221	These numbers are 420 in excess of the true number—owing to a duplicate entry.	

It would thus appear that nearly 10,285 of the bodies died of disease, or in ways not positively ascertained to be violent; and that 11,936 died violent deaths, which involved charges of murder, manslaughter, or justifiable homicide in 482 cases. Ultimately 265 persons were, according to the Criminal Returns, committed to trial for homicide (murder 82, manslaughter 183); and 109 were convicted (31 of murder and 78 of manslaughter).† Of the 31 convicted murderers, including Palmer, 16 were hanged. This was the ultimate result of 21,801 inquests; 109 men and women were convicted of homicide, and variously punished. It is asked, upon the face of this return, "Whether, under our police system, such a number of inquests, leading to no results, is necessary?" "No evidence," it is said, "of crime to satisfy a coroner's jury was found in 21,325 cases; and of the 476 verdicts of murder and manslaughter only a few were sustained by sifted evidence before the judges, for only 109 convictions ensued."

It must, however, be recollected that 1,314 suicides are included in the return; and the importance of inquiring into these cases will not be disputed. If a man has executed himself for crime, or in a state of delirium has destroyed himself, it should be known; and murder may sometimes be disguised under appearances of suicide. 3,183 bodies were *found dead*; and the utility of inquiry into all these deaths will scarcely be questioned.

War, homicide, and deaths by wild beasts are probably the principal causes of violent death in uncivilized countries; but the development of mechanical forces in a country is not always accompanied by corresponding safeguards. Horses, untrained by Mr. Rarey, are at first ridden recklessly; carriages are upset by unskilful drivers; children are exposed to death; young ladies are dressed in elegant muslins, but muslins still inflammable, which sometimes, alas! burn away their beauty and reduce them to ashes; light-houses and life-boats are often unprovided, and are often of no avail. Men are destroyed by explosions in mines for the want of adequate ventilation; by defective machinery; and by carelessness. In factories death arises from unfenced machinery. Railway accidents are sometimes accidental, sometimes the consequence of bad

* These numbers are corrected for a duplicate entry in the original Table. The corrections are made on Mr. Redgrave's authority. The details cannot now be corrected.

† Criminal Returns 1856.

arrangements, and sometimes the results of carelessness. Drunkenness is frequently a cause of accidental death. The examination of the whole series of violent deaths shows conclusively that the coroner should sit in every case, for the denunciation of the guilty, for the comfort of the innocent, and for the information of the public, who should be taught the nature and the extent of all the dangers by which they are surrounded: for some of those dangers they will learn to avoid, and many of them can be diminished or entirely removed.

Whenever a death occurs suddenly it is wisely enacted that an inquest shall be held; and in interpreting the word "sudden" the fact that the deceased has or has not been recently visited by a legally qualified medical practitioner should be taken into account. Under this interpretation a considerable number of inquests is held on persons who die of common diseases, the effects of which, if scrutinized by medical witnesses, leaves little doubt of their nature. The supposition of violence is thus negatived, and this decisive result is ample compensation to society for the expense.

Virtually, it is true that of twenty-one thousand inquiries only a few lead to the committal and conviction of criminals; but the utility of the inquest is not to be proved by the number of *crimes committed*, but by the number of *crimes prevented*; and it is gratifying to find that homicide is comparatively rare in England and Wales. Few countries present so low a proportion of murders. Yet, the instant that the provisions of the law are disregarded, and inquests are not freely held, such homicidal eruptions break out as the poisonings in Essex, the atrocities in Norfolk, which Sir James Graham feared "had resulted from an interference with the duties of the office of coroner," and the systematic poisonings of Palmer, in Staffordshire, who was executed in the year (1856).* The increase of subtle poisons lying for sale in the shops, the increase of life insurance, and the immense number of violent deaths in England, demand the observance of all the existing safeguards of life.

The legislature, in the year 1837, extended the inquiry under the Registration Act so as to make it embrace the cause of every death in England and Wales. The informant, in registering a death, has to answer the question, What was the cause of death? and in all cases of inquest on any dead body it was enacted (6 & 7 Gul. 4. c. 86. s. 25.), that "*the jury shall inquire of the particulars herein required to be registered concerning the death*, and the coroner shall inform the registrar of the finding of the jury, and the registrar shall make the entry accordingly."

In a letter which was published in the Appendix to your third annual Report (1841) I discussed the coroners' returns of violent and sudden deaths.† The defects in the "information" were pointed out; and in the year 1845, after further experience, you addressed a letter to coroners, accompanied by observations on the registration of the causes of violent deaths. Your letter to the coroners concluded in these words: "I confidently anticipate that for the future, in all cases in which inquests shall be held, the finding of the jury, as recorded in the register book of deaths, will contain all the particulars which it is desirable to ascertain."

It is gratifying to find that the "cause of death" as returned by the coroners exhibits improvement. That the information is still very imperfectly given in many cases will, however, be evident, upon the most cursory inspection of the Tables (pp. 162–9). Thus it will be seen that in the case of railway accidents the nature of the accident is not

* It was stated before a Committee of the House of Commons in 1851, that the constabulary of Staffordshire were instructed not to furnish "notices" of deaths to the coroners, except when crime was *suspected*. And the coroners were informed, that if they held inquests in such cases their fees would be disallowed. Under these regulations Palmer committed several murders.

† Third Annual Report, App. pp. 75–97. See also Sixth Report, pp. 210–66.

defined in a large number of instances: the deaths in mines are well described: of the deaths by burns, 2181 are referred to the clothes taking fire in the 5 years 1852–6, and 75 to conflagrations, but in 7,739 cases the circumstances are not distinguished; the poisons are not stated in many cases of death by poisoning; the deaths by drowning are often obscure, but they are evidently imperfectly returned where the cause can be ascertained; we learn that 588 persons were drowned while bathing, 215 by falling from ships and boats, 265 by shipwreck, 4 while sliding and skating, and in the greater part of 11,758 cases of drowning the information is left imperfect. Suffocation was the cause of 1,624 deaths, which were left unclassified. The coroners' returns state that in 1856 the verdict of suicide was returned in 1,314 cases; only 1,182 were distinguished in the registers, owing, it is believed, to obscurities in the verdicts. In 195 cases of suicide, 182 of murder, 257 of manslaughter, 2,402 of accident in the 5 years 1852–6, the means by which death was caused are not expressed; thus, it is impossible to learn the total deaths from poisoning or from drowning, or from any particular agent, through these serious oversights in the coroners' returns. In the calculations it has been necessary to distribute 5,328 cases of violent deaths so as to get approximations to the numbers of deaths by railways, mines, mechanical injuries, chemical injuries, and asphyxia. Yet this classification was expressly made to include the greatest number possible of the facts as

TABLE (11.)—DEATHS from RAILWAY ACCIDENTS from 1852 to 1856, both inclusive, in England and Wales, Scotland, and Ireland respectively, *as reported to the Board of Trade.*

Years.	England and Wales.	Scotland.	Ireland.	Total.
1852	181	24	11	216
1853	243	36	26	305
1854	180	29	14	223
1855	214	14	18	246
1856	232	30	19	281

TABLE (12.)

The Abstract of the Causes of Death in England and Wales shows that in the year 1856, 548 persons lost their lives from Violent Causes in connection with Railways in England and Wales. They are thus returned:—

Run over on line	306
Fall from carriage or engine	22
Collisions	11
Carriages off rail, &c.	7
Explosion of boiler	7
Killed between buffer	8
Fall of earth	3
Other deaths (*manner not stated*)	184
Total	548

Similar Accidents attended with Death reported to the Board of Trade as having occurred in England and Wales in 1856:—

Run over on line	137
Fall from carriage or engine	35
Collisions	14
Carriages off rail, &c.	10
Explosion of boiler	1
Killed between buffer	23
Fall of earth	Nil.
Other deaths	12
Total	232

Captain Galton, R.E., in explanation of the discrepancy, makes the following remarks: "I believe railway companies return to us *all* fatal accidents to passengers, except perhaps occasionally when death ensues a long time after the accident; but probably not more than one half the fatal accidents to their own servants are returned; and I believe that many cases of fatal accidents to trespassers are not returned. We endeavour to get as complete returns as we can, but the law only requires returns of accidents to passengers."

they were returned in 1840; and we are scarcely yet prepared for a more minute classification.

The Tables (pp. 162–180) contain, nevertheless, much useful information. The returns are for the *five* years 1852, 3, 4, 5, 6. They include 68,554 violent deaths. On an average 13,711 such deaths were registered annually; of males 10,057, of females 3,653. Thus to *one* female *three* males die by violence.

On an average 480 deaths are returned as occurring annually by railways; the numbers rose from 391 in 1852 to 548 in 1856. The number of the deaths by violence from these as well as other particular causes is probably understated, as it has been already remarked that the manner in which some accidents occur is not distinguished. Yet these numbers greatly exceed the deaths returned to the Board of Trade. In 1856 the Board received accounts of 232 deaths from railway accidents, whereas 548 deaths were registered as having occurred in connexion with rails, railway carriages, and railway works. (Tables 11, 12.)

In mines 1,136 persons were killed annually; 985 in coal mines, 151 in copper, tin, lead, and other mines. We hear chiefly of deaths by explosions in coal mines, but accurate registration shows that the deaths by the explosion of fire damp are 198 to 939 from other causes. The fall of coal, stone, &c. kills 509 men and women in mines annually, including the crushed; 157 fall into the pits or shafts. Few women are killed by either railways or mines. The deaths by all other mechanical injuries are 4,157 annually, comprising the deaths of 3,328 males and 829 females. Falls from heights, scaffolds, windows, stairs, ships,—and falls in walking,—kill 1,077 persons annually; of whom 253 are females, falling chiefly from heights, windows, or down stairs. The fall of heavy bodies kills 332 persons annually. 1,107 persons are killed annually by horses and horse conveyances; more than double the number killed by railways. The numbers exposed constantly to accidents of this kind are probably greater than the numbers exposed to accidents on railways. The accidents by horses and horse conveyances make less noise in the world than railway accidents; and it is only when the aggregate results are collected by registration that the truth is revealed. The returns are however defective; for 546 annual deaths are referred simply to fractures, leaving the cause of the fractures unspecified.

584 persons die annually by wounds; 161 by gunshot wounds; 233 by cut throat, and 190 by other wounds. A large number of these deaths are suicides.

3,045 persons died annually of chemical injuries, that is, almost exclusively by burns and scalds. 1,184 females are burnt to death; 815 males. And how is it that so many females die this painful death? The coroners have not yet enabled us to answer the question explicitly. But of the 451 cases where the information is given, 436 were from the clothes taking fire, and only 15 from fires. In the *five years* 1,349 females are stated to have died from the clothes taking fire; 890 were girls under 10 years of age, 173 were of the age 10–25, and the rest were women of higher ages. Of the 832 males who died from their clothes taking fire, 526 were boys under 5 years of age, 226 were boys of the ages 5–10, and only 80 were of the age of 10 years and upwards. At these early ages the boys as well as the girls wear combustible clothes. Of the 3,195 males and the 4,544 females who died of burns, though in what way the returns do not state, a large number undoubtedly died in the same way. The discovery of these appalling facts will, it may be hoped, lead to new precautions against this danger; and probably the clothes will in the end be rendered by some chemical process incombustible. Of scalds by drinking scalding water, 142 males and 88 females, nearly all children under five years of age, are stated to have died. The larynx is closed in these unhappy cases, and the child is suffocated. Such deaths will be diminished

by greater care. Teapots and other vessels containing scalding water will be placed beyond the reach of the children. It will be observed that the young boys are more incautious than the young girls; 125 boys and 79 girls of the ages 1 and under 4 died by drinking scalding water.

The deaths by lightning are so interesting in a scientific point of view that it was thought right to give them in detail. The deaths of males and females at different ages, and in the several divisions and counties, are shown.

401 persons died *annually* of poisoning; and in nearly 113 cases the poison is not specified. Opium is the principal specified poison; by that drug 125 persons are said to have died, namely, 89 by laudanum, 34 by opium, and 2 by morphia. 34 persons were killed annually by prussic acid, including 15 by the essential oil of bitter almonds. Arsenic stands next, and to it 27 annual deaths are referred. The salts of lead kill 23 persons annually, the salts of mercury kill 10, oxalic acid kills 13, sulphuric acid (oil of vitriol) kills 15 persons annually. The deaths from these poisons are understated, as the 113 deaths from unspecified poisons are chiefly caused by them, and in some cases the poisoning is not dis-

NOTE.—In calculating the Annual Mortality the Deaths of Persons whose Ages were not stated have been distributed proportionally over the different Ages in the Table. The Deaths referred to Suicide (manner not stated) have also been distributed proportionally over the various classes. The numbers are still under-stated, and should be raised about one ninth part if the coroners' returns to the Home Office be taken as the basis of an estimate.

medical prescription. Quack medicines, overdoses, and improper medicines are stated to have caused 183 deaths in five years.

3,826 annual deaths are the result of interrupted respiration (asphyxia), including 2,566 deaths by drowning. These returns are incomplete. Persons drowned at sea, whose bodies are not washed on the English shores, are not registered; hence large numbers of the maritime population perishing in the sea remain unregistered. Of the dying by drowning 2,044 were males, 522 were females; they were generally adults. Bathing, shipwreck, falls overboard, are the principal assigned circumstances to which drowning is referred, but the circumstances are unassigned in nearly 2,352 cases.

Suffocation is stated to have caused 708 deaths annually; it was referred to choking by food in 57 cases, bedclothes in 183 cases, overlaying in 106 cases, mephitic gas in 16 cases, limekilns in 13 cases, charcoal in 3 cases. But the cause of suffocation was not stated in nearly half the cases.

494 persons die by hanging every year, 384 males and 110 females; and 50 are strangled annually.

Some of the persons executed have not been distinguished in the registers from other persons hanged; instead of 35, the number actually executed in the five years was 45.

I have already referred to the imperfect returns of 195 suicides, 182 murders, 257 manslaughters, 2,402 accidents, 1,684 injuries. Often the way is not ascertained in which infanticide is committed.

Suicides.

1,083 suicides were returned annually so as to be distinguishable in the register*, which is probably less by a tenth than the numbers actually distinguished. Hanging is the most common form of suicide; cut-throat and drowning stand next in the order of frequency: eight-tenths of the suicides are committed in one of these three ways.

The tables show how a few of the murders and manslaughters were committed. The information is very defective.

The annexed Tables show some of the most striking results deducible from the returns in their present state. (Tables 13, 14, 15.)

TABLE (15.)—MURDERS AND INFANTICIDES AND MANSLAUGHTERS IN ENGLAND AND WALES.—AVERAGE ANNUAL MORTALITY to 1,000,000 LIVING in the 5 Years 1852–56.

DEATHS OF MALES to 1,000,000 LIVING at each of 12 different PERIODS OF LIFE.

	All Ages.	0–	5–	10–	15–	25–	35–	45–	55–	65–	75–	85–	95 and upwards.
MURDERS AND INFANTICIDES	12·8	68·8	1·6	1·6	3·2	7·0	4·2	6·3	2·8	3·6	6·0	-	-
MANSLAUGHTERS - - -	8·0	2·3	2·0	2·8	8·9	12·7	13·1	13·2	8·0	9·4	11·9	-	-

DEATHS OF FEMALES to 1,000,000 LIVING at each of 12 different PERIODS OF LIFE.

MURDERS AND INFANTICIDES	9·7	89·1	2·4	·8	·8	2·7	2·7	4·0	4·0	4·4	9·4	-	-
MANSLAUGHTERS - - -	2·4	3·0	0·7	1·4	1·3	3·6	2·9	3·2	4·0	3·1	4·7	10·2	-

NOTE.—In calculating the annual mortality the deaths of persons whose ages were not stated have been distributed proportionally over the different ages in the Table.

---

* In 1856 the suicides distinguishable in the registers were 1,182; the coroners' returns in Mr. Redgrave's Tables (p. vii.) make the suicides 1,314, from which a few should be deducted for the duplicate return.

V. Suggested Improvements in the Coroner's Inquest.

The inconceivable importance of these inquiries will be evident from the number of the violent deaths, which exceed the deaths in all our wars, and may undoubtedly be prevented to a large extent.

The contentions of the county coroners and the magistrates have already been referred to. The county coroners pay the expenses of inquests, and are afterwards reimbursed out of the county rates. By a decision of the courts of law, the magistrates consider themselves justified in deciding in every case after the inquest has been held whether it was "necessary." If they consider it unnecessary, they stop the coroners' fees. The utility of the coroner's office is greatly impaired by this state of things. The cause of death is sometimes not ascertained. He ceases to be responsible for holding inquests, which are disallowed on no settled principles. Cases occur in which the coroners refuse to hold inquests on the bodies of persons dying by violence, dying suddenly, or found dead; and in other cases they hold inquests for which they are mulcted to the full extent of their fees and allowances. The coroner is thus degraded in the eyes of the country. His is a high judicial office, and yet it is assumed that for the sake of putting a fee in his pocket he will hold an unauthorized useless inquest on a dead body. The censorship is an invidious office, and is as injurious to the magistrates as it is to the coroner. They are appointed by the crown; he is elected by the freeholders. The jurisdictions of the offices are sometimes conflicting. The coroner holds inquests in prisons, and in county lunatic asylums, which are under the control of the magistrates. The magistrates are not elected by the ratepayers; and their limitation of the expenditure on an institution which has the protection of the life of the people for its object is viewed with suspicion. No unseemly disputes appear to have arisen in boroughs where the coroners are paid by the representatives of the ratepayers.

All the expenses of the county coroners are now paid out of the county rates. They were formerly paid out of the poor rates it is believed, with the exception of the coroner's fees. And more inquests are now required than were necessary formerly, when violent deaths were of rare occurrence. The aim of the magistrates is apparently to keep down the county rates. But it has been seen that all the expenses of inquests amounted to 67,000*l.* This is a small portion of the county rate. The 324 coroners of the whole of England and Wales received 29,068*l.* in fees in the year 1856; or rather less on an average than 90*l.* each. After deducting 91 coroners who held less than ten inquests each in the year, the incomes of the rest was about 123*l.* on an average. The highest income amounted to 1,692*l.* The mileage was fixed in the last century, and is evidently too low in many districts. The coroners pay the salaries of their deputy coroners and clerks out of the above incomes.

Of all judicial officers the coroner appears to be paid on the lowest scale. Yet his office is subordinate to none in importance. Its requirements are high. He should inspire public confidence by his intellectual as well as by his moral qualities. Without a knowledge of medical jurisprudence in its extensive sense, it is impossible to conduct satisfactorily an inquiry into the causes of deaths, often surrounded by unusual obscurity. His duties are by no means attractive. He is liable to be called upon to hold inquests at all times. The inquiries are often protracted. It is his duty to view the dead bodies in all their revolting changes. His mind is conversant chiefly with deadly accidents; with the sudden deaths from which people pray to be delivered; with suicides; with infanticides; with manslaughters; with dismal murders, which no poet's art can turn into tragedies.

It is the men undertaking all these painful duties whose pay is constantly liable to be disputed by the magistrates. And no other judicial

officer is paid in the same precarious way. What would be thought of a proposal to make the pay of the county court judges depend on the number of their decisions, and to allow them to adjudicate only in such a number of cases as the county magistrates consider reasonable. The judges are not fined, as the coroner is, when their decisions are reversed. The chief coroner of England, the Lord Chief Justice, is not paid by fees; and instead of a precarious income he enjoys a certain salary, with a vested right in a pension. The coroner is paid by fees, which can be withheld by the justices; his income fluctuates; and when he is old and disabled, he has no pension to retire on.

The subject is so important that it should be inquired into. And the comparative merits of the pay by fees and by salary should be carefully weighed. The unseemly contention between two high classes of the officers of justice should be brought to a close. When the coroners' pay is placed upon a proper footing, several improvements might be introduced into the conduct of the inquest. Certain classes of cases should be laid down in which inquests should invariably be held; and others should be held on the coroner's responsibility. It should be proclaimed that the inquest involves no suspicion; as indeed its most important function is to dissipate unfounded suspicions. Without an examination of the organs of the body, and often without an analysis of their contents, the cause of death cannot be determined, either negatively or affirmatively. And this examination would be most satisfactorily conducted by one medical officer in each district, who would become by experience expert in manipulation, and sagacious in judgment. He might undergo, before his appointment, a special examination in medical jurisprudence, and be very properly the health officer of the district.

While all existing rights are scrupulously respected, and the selection is left in the hands of the freeholders, it would perhaps be found possible to diminish the exorbitant expenses of contested elections, and at the same time to secure adequate acquirements in the coroners. Physicians, surgeons, clergymen, barristers, solicitors, now undergo examinations. Why should not the future candidate for the office of coroner be required to produce a diploma, certifying the possession of a competent knowledge of medical jurisprudence?

These improvements would necessarily raise this important office to its proper dignity, and greatly increase its public utility. The causes of death would be ascertained. New safeguards of human life would be provided.

I have the honour to be,
Sir,
Your obedient and humble servant,
WILLIAM FARR.

To
The Registrar-General.

REPORT

TO THE

REGISTRAR GENERAL on the INTERNATIONAL STATISTICAL CONGRESS at VIENNA, by WILLIAM FARR, M.D., F.R.S., D.C.L.

SIR,

AT your instance Her Majesty's Government was pleased to appoint me as one of the two Delegates of England to attend the Third International Statistical Congress in Vienna. I was the colleague of Mr. Fonblanque of the Board of Trade.

I left London on August 22d, and upon arriving at Vienna learnt to my great regret that Mr. Fonblanque had had on the way an attack of illness, at Frankfort, and that his physician forbade his travelling any further.

The Congress met at mid-day on Monday, August 31st, in the Chamber of the Lower Austrian States. Several Ministers of the Imperial Government and official delegates from nearly all the principal States of Europe were present; besides about four hundred other members, chiefly, but not exclusively, Austrians and Germans. As soon as the meeting was opened, the Minister of Commerce, the Chevalier von Toggenburg, on the part of the Government, greeted the Members; and addressed them in a discourse, of which the following is a translation:—

"Gentlemen,

"The capital of Austria had no sooner been selected for the place at which the Third Meeting of the International Statistical Congress should be held, than the Government, having obtained the gracious permission of His Majesty, immediately made the necessary arrangements for furthering to the utmost the object of the meeting. It wishes you success in your labours the more confidently, as it sees here so many representatives of science and of the various branches of administration, who have responded to our invitation.

"We welcome you then, Gentlemen, on the banks of the Danube. But first of all let me thank the Governments who by sending official delegates have shown how desirous they are to maintain for the Statistical Congress its true character, as a means of drawing closer the bonds uniting nations, by establishing the incontestable and uncontested utility of its labours for the weal of the civilized world.

"The idea of such assemblies has from the beginning been favourably entertained in Austria, and I trust that in the course of your investigations you will discover that in our Official Statistics we have not failed to take into account the previous decisions and wishes of the Congress.

"The object of these periodical Congresses is to arrive at uniform principles in conducting Statistical Inquiries, so as to render the comparison of their results possible; for, as one of the most distinguished founders of the Congress justly remarks, 'without the possibility of comparing observations, progress in the Sciences based on observation is impossible.'*

"In the position which the science of statistics now holds in every State of Europe, this alone is required for its completion. And in fact

* M. Quetelet.

since statistics is no longer viewed as a mere theoretical science for the gratification of the curiosity of the learned; since, on the contrary, it specially subserves the practical ends of political society, and lends its service to administrations as well in determining the value of existing institutions and laws as in weighing measures not yet carried out; since statistics, I say, has obtained such an important place in our governmental system, your investigations are neither arrested by the fulness of its materials nor by the manifold nature of its subjects. It is, then, above all essential to establish such an order and subdivision of the materials as may render it possible to represent the observations in the several countries under the same point of view, and thus to establish truths and laws which the human mind could never divine by pure speculation.

"This is without doubt a great and difficult problem, and therefore deserving of the zeal with which you have undertaken its solution. If you make your observations the common property of all, if you impress upon them the stamp of a loftier truth, if you place the results deduced from the facts in a clearer light, will you not thereby aid the Governments in accomplishing their special mission, the improvement of the political condition and of the moral and material well-being of the people?

"And if you, through a uniform system of statistical tables and a uniform nomenclature, bring the Statistics of the various states nearer to each other, do you not share my opinion that this uniformity in the form will react on the material, and ultimately bring about an approximation in the laws and institutions? I can therefore safely say that this day, in the midst of us, you resume your labours and devote yourselves to the study of a problem in civilization, the solution of which, rest assured, will obtain the sympathy of all governments and the applause of all nations."

His Excellency then addressed the German members, and congratulated them on this first meeting of the Congress on German ground. He reminded them that the necessity of statistical unity applied with twofold force to Germany, and suggested that it would be a happy circumstance, if out of the meeting a more intimate connection arose between the Statistical Departments of German States. This would also promote the great end of the Congress. He then thus concluded his address :*

"I conclude, Gentlemen, by assuring you of the entire sympathy of the Imperial Government, which follows your labors with the greatest interest; and I express its sincere wishes that the third meeting of the Statistical Congress may be as rich in useful results as the two which preceded it."

His Excellency's speech was warmly applauded.

Baron Czœrnig, the President elect, occupied the chair; supported by the Official Delegates, who were nominated Vice Presidents. M. Quetelet, in a brief statement, described the objects for which the Congress was founded.

Reports *of* Delegates *from the* Governments *of the* States *of* Europe.

All the principal States of Europe, except Naples, have sent delegates to the Congresses. Sardinia and Prussia, however, sent no delegates to Vienna; Russia, Turkey, and Spain sent delegates to the Congress there for the first time. As is usual the delegates of those States gave an account of the national statistics.

---

* Translated from the German Report in the Wiener Zeitung, No. 200. The first part of the Address was delivered in French.

DAOUD EFFENDI, the representative of the Sublime Porte, expressed the interest with which the first meeting of the Congress had been regarded in Turkey. And he anticipated the greatest advantage from the results of their deliberations, which would lessen the difficulties of the Government in the establishment of a system of statistics in his country.

As nothing would possess greater interest than correct statistics of this vast and important Empire, connecting Europe and Asia, so nothing probably would be more advantageous to the Sultan's Government.

His speech, characterized by brevity and truth, was well received. Than Daoud Effendi the Turkish Government could scarcely have had an abler representative. He is the author of an excellent classified arrangement of the Anglo-Saxon and other ancient German laws and institutes.

COUNT RIBALDO said that in Spain a central commission had been appointed under the presidency of the Duke of Valencia, which in conjunction with local commissions had been charged to take a census. This great statistical report would speedily be published; it had been drawn up with a special regard to the recommendations of the Congress.

BARON REDEN gave a short account of the statistical operations in Brunswick.

M. VERNADZKY, the Councillor of State who represented Russia, traced the statistical records of the empire from the year 1246 down to the present date; giving an interesting account of the various methods which the Imperial Government employs in procuring information.

Peter the Great and Catherine—like Augustus in Rome, William the First of England, the Emperor Napoleon the First, and all great administrators,—perceived the importance of obtaining information in a statistical form, so as to be able to analyze all the forces and products of their dominions.

A statistical committee, M. Vernadzky said, was founded in 1802, and still exists. It is connected with 33 committees in the provinces; and the Minister of the Interior has since 1852 directed several expeditions for statistical enquiry to be undertaken. The statistical section of the Geographical Society and other bodies devote themselves to particular inquiries.

Russia is at present acting in the spirit which Tegoborski displayed, and is making laudable efforts to place on a sound footing the statistics of the empire—presenting on several accounts unusual difficulties to statistical inquiry. An improved census, which is the basis of statistics, is likely to be soon undertaken.

M. HOPF, Finance Councillor, well known in England as the Manager of the Gotha Insurance Office, gave an account of Saxe-Meiningen, Saxe-Altenburg, and Saxe-Coburg.

M. RATHGEN reported that in Saxe-Weimar, ever since 1816, annual reports of the population, and of the births, deaths, and marriages had been obtained. The summary of the results was published in the State Manuals and the Weimar Zeitung, which contained also statistical reports on the property in land, on mortgages, and on finance; also judicial statistics.

MAYER VON KNONAU reported, that the Swiss Confederation had not, as such, any statistical department; and the absence of this had only been supplied by the unwearied industry of Franscini, the Minister of the Interior, in the contributions to the statistics of Switzerland, which were continued down to the date of his death. In the Cantonal Reports important statistics might be found, but they were of limited extent and view. Cartography had been diligently studied. In fine, both the Confederation and the several Cantons were devoting increased attention to physical statistics.

M. FAUL, Chancery Councillor, said that in Mecklenburg-Schwerin a *statistical* commission had been constituted of members of the principal

state offices in 1851. The commission had published various reports in the Mecklenburg Archives.

Baron Baumhauer mentioned that in Holland medical reform bills had been introduced into the Chambers, and that it had been proposed in a public burial bill to render the grant of medical certificates of the cause of death compulsory. This bill had not yet passed. A grant of 5000 florins would be asked for with a view to establish a central commission of statistics. An essential improvement of the census law is in preparation. The statistics of Holland—it may here be remarked—occupy a high place, from the value of their information, their form of publication, and the able commentaries of Baron Baumhauer.

Professor Wappäus said that in Hanover a new director of the statistical department had since 1855 introduced great improvements in the statistical publications of that kingdom. The two last publications gave the results of the censuses of population 1852–5, and of the enumeration of the cattle in 1853; also returns of deaths in 1853–5.

Baron Sick stated that in Wurtemburg a central statistical commission had been formed by attaching representatives from the several offices to the Statistical and Topographical Department. The commission could take up any subject and meet at any ministry. Among its labours may be mentioned the summary of the births and deaths in the years 1846–56.

Professor Aschehoug, of Norway, said that the statistical office there embraced all branches of the administration, except the administration of justice, public education, and certain branches of finance. It is occupied mainly on the census of 1855, the statistics of industry, commerce, shipping, and the returns of births, deaths, and marriages. The land valuation had, on account of its practical bearing, attracted great attention. The statistics of this fine people are full of interest.

Under the regulations the business of the Congress was transacted either in German or in French. At this stage I made the following report on the progress of official statistics in England:—

"L'Angleterre dès la première réunion du Congrès International de Statistique a toujours compris son importance et sa grande utilité. C'est ainsi que le Gouvernement de Sa Majesté la Reine a nommé deux représentants à Vienne comme à Paris. Malheureusement mon collègue, M. Fonblanque, tombé malade en route, ne peut assister à nos réunions. Vous regretterez avec moi, Messieurs, son absence et la cause de cette absence. Il avait preparé une note sur le progrès de la Statistique Commerciale en Angleterre depuis la seconde réunion du Congrès. Avec la permission de l'Assemblée je vous en donnerai tout à l'heure lecture en Anglais. En ce qui me concerne je ne vous entretiendrai que des changemens qui ont eu lieu dans la Statistique Officielle depuis la dernière réunion du Congrès—et dont quelques uns sont dus à vos delibérations.

"L'état des recettes, des dépenses, et de la dette publique est publié annuellement depuis longtemps, et avec beaucoup de détails.

"J'ai l'honneur de mettre sous vos yeux un exemplaire de l'État Financier (Finance Accounts) pour l'année qui a fini le 31 Mars 1857. Vous y verrez que les recettes se sont élevées à 75,350,825 *l.*, ou à peu près à 753,508,250 florins. Voilà les revenus enormes que le peuple a voulu voter par ses représentants, et qu'il a pu vouer sans gêne, à la chose publique sous l'empire vivifiant de la libre concurrence. Les dépenses n'ont été que de 68,097,287 *l*, ou à peu près de 680,972,870 florins. L'intérêt de la dette publique a été 28,681,177 *l.*, ou à peu près à 286,811,770 florins.

"J'ai l'honneur de placer sous vos yeux d'autres documents entièrement nouveaux; ce sont les Rapports raisonnés de l'administration des Douanes, des Recettes perçues à l'intérieur; et du produit de la Poste. On y trouve des explications et des résumés historiques d'un très grand intérêt.

"Je dois reconnaître que la classification des faits n'a pas été inspirée par la statistique; et qu'il y manque notamment le *Tableau de la fortune de*

l'État, dont parle M. le Chevalier Hock dans sa note lumineuse, et dont nous serons, sans doute, unanimes à reconnaître la nécessité. Des comptes communaux sont publiés annuellement par l'administration des pauvres. D'après le dernier de ces comptes les recettes de 1856 pour l'Angleterre et le pays de Galles étaient de 8,496,458*l.*, ou à peu près de 84,964,580 florins ; les dépenses de 8,212,012*l.*, ou à peu près 82,120,120 florins. Cette somme ne comprend pas les dépenses des routes de tout genre, ni quelques autres dépenses locales.

"Pour la rédaction de ces divers états je crois que nous profiterons largement des travaux de la troisième section.

"Il faut constamment se rappeler qu'en ce qui concerne les finances de l'état il ne saurait y avoir de terme moyen entre le silence absolu et la publication franche et loyale de la vérité. Les capitalistes peuvent toujours faire payer cher le silence, et encore plus cher l'imperfection des comptes publics ; ils nous pardonneront, si, dans l'intérêt de la science, nous leur enlevons à jamais cet avantage, qui, vraiment, à la fin, *not enriches them, and makes us poor indeed.*

"En ce qui concerne l'Irlande et l'Écosse des rapports annuels font connaître les superficies consacrées aux diverses cultures, et contiennent des évaluations plus ou moins exactes sur les produits agricoles, et sur le nombre des animaux domestiques.

"Lord Stanley d'Alderley, Ministre du Commerce, a compris toute l'utilité de l'extension de la statistique agricole à l'Angleterre, proprement dite, et nous esperons que dans l'intérêt de l'agriculture même, la législature adoptera le projet de loi qui lui a été soumis à cet effet par M. Caird, agronome Anglais des plus éclairés. Je mets sous vos yeux un exemplaire du Rapport sur les produits agricoles de l'Irlande en 1855.

"Lord Brougham, prenant en considération particulièrement les recommendations du Congrès de Paris, a soumis un projet de loi sur la statistique judiciaire à la Chambre des Pairs ; et M. Redgrave a inauguré la réforme de cette statistique dans l'Angleterre. Je dépose sur le bureau du Congrès un exemplaire de la première partie de son travail.

"Nous possédons de très bonnes cartes à l'échelle de 1–10560 pour l'Irlande, et de bonnes cartes pour la plus grande partie de l'Angleterre, et pour une partie de l'Ecosse à l'échelle de 1–63360. Conformément aux recommendations du Congrès de Bruxelles le Gouvernement de sa Majesté s'est déterminé à faire dresser des cartes générales à l'échelle de 1–2500, et des cartes des villes à l'échelle de 1–500. Déjà les cartes de plusieurs comtés et de plusieurs villes ont été dressées sur ces échelles. Ce travail a été malheureusement suspendu. Les avantages qu'offrirait une carte de l'Europe à une échelle uniforme sont évidents : ils ont été démontrés à la Chambre par le Vicomte Palmerston ; et nous croyons qu'ils seront appréciés par la commission royale qui est chargée de l'examen de la question. Une grande majorité des savans de l'Angleterre a exprimé des vues qui sont en complet accord avec celles du Congrés. Je dépose sur la table le dernier Rapport du Colonel James : il contient des specimens rémarquables des cartes que l'on a déjà executées et des réductions à l'aide de la photographie.

"Le Registrar-General vient de publier son 18^{me} Rapport, et il prie le Congrès d'en accepter deux exemplaires.

"Je me suis occupé dernièrement d'une enquête sur laquelle je demanderai au Congrès la permission d'appeler son attention ; c'est l'organisation du travail,—ou plutôt la classification de la population par professions. La quatrième section du Congrès rendra des services des plus importants ; elle a en vue particulièrement les produits de l'industrie : l'enquête dont je parle regarde spécialement la disposition et la condition variable des hommes,—maîtres et ouvriers. Je dépose sur le bureau notre questionaire. Je dirai seulement que nous avons commencé notre enquête par la pro*fession* des mineurs, qui sont en grand nombre chez nous. En 1851 on

en a compté *deux cent cinquante deux mille*, dont 182,180 travaillaient à l'extraction de la houille.

"Je ne dirai rien quant à présent de leur condition économique. Je me bornerai à faire connaître que ces hommes intéressans sous tant de rapports à l'égard de leur santé souffrent beaucoup dans certaines circonstances et en aucune manière dans d'autres. La mortalité sur 1000 dans quelques districts à l'âge de 20–40 est de 19; c'est le double de la mortalité de la population mâle générale aux mêmes âges. On croirait d'abord que cette mortalité exceptionnelle est due au travail souterrain: point du tout; car dans d'autres comtés, ou les mines sont sur la plus grande échelle (Durham et Northumberland), la mortalité n'est que de 8 par mille. Nous ferons connaître les causes de l'excès de la mortalité; et il vous sera évident que ces causes ne sont point du tout inhérentes à ce genre de travail; qu'elles peuvent au contraire disparaître de l'industrie des mines.

"Nous venons de faire aussi des recherches recentes sur la mortalité de nos armées; et j'éspère que le Congrès voudra bien en prendre connaissance. Il serait vivement à désirer que des recherches semblables fussent faites sur toutes les armées de l'Europe. Le soldat Anglais, comme vous savez, se trouve dans tous les climats; et la mortalité qu'il a éprouvée pendant les dernières années est de 33 par 1000. La mortalité des troupes en Angleterre est de 18 sur 1000; tandis que la mortalité de la population mâle aux âges correspondants (20–40) est de 9 sur 1000. Ainsi la mortalité des troupes est telle que le pays perd *deux hommes* où il ne devrait en perdre qu'*un*, suivant la loi de la mortalité naturelle. Constatons si les faits sont les mêmes dans les autres pays? C'est à la statistique de répondre. S'il en était ainsi on pourrait croire peut-être que le soldat vivant paisiblement en garnison est soumis inévitablement à une mortalité double de celle des autres hommes. Des recherches faites chez nous démontrent cependant l'existence des causes bien évidentes de la mortalité excessive du soldat; et quelques unes de ces causes peuvent être éloignées, notamment l'encombrement des casemes. Comme membres du Congrès nous ne saurions être partisans de la paix à tout prix, et encore moins de la guerre à son prix actuel: nous ne devons même pas discuter ces questions; mais s'il nous appartient d'employer la statistique à l'amélioration de la population civile nous pouvons à plus forte raison l'appliquer à améliorer l'état sanitaire des armées. Dans ce cas nos soldats pourraient bien continuer à mourir sur le champ de battaille, mais il succomberont en moins grand nombre qu' à présent aux maladies qui remplissent les hôpitaux militaires, et dont ils ont été atteints faute de recherches statistiques.

" Avec votre permission, M. le Président, je vais maintenant donner lecture au Rapport de mon ami M. Fonblanque tel qu'il l'a écrit, c'est à dire en bon Anglais, au lieu de le traduire en mauvais Français. Vous verrez que l'Angleterre s'est vraiment associée à vos honorables travaux—ces travaux qui ont commencé à Bruxelles sous les auspices de l'un des premiers statisticiens de l'Europe—qui ont pris un grand développement en France—et qui recevront, je crois, un nouvel élan des lumières et de la coopération du Gouvernement de ce vaste Empire, qui nous a reçus dans sa ville capitale avec tant de bienveillance. Nous apprécions tous le " *Willkommen an den Ufern der Donau* " que M. le Ministre du Commerce a bien voulu nous adresser hier."

REPORT of Statistical Progress in the Department of the BOARD of TRADE, by A. W. Fonblanque, Esq.

Since the meeting of the second International Congress in Paris the Statistical Department of the Board of Trade has, in addition to its usual serial accounts, published a volume of the general resources and trade of the British Colonies and Dependencies, and also an abstract of the

Statistics of the Hanse Towns; Holland, with Java and Sumatra; France, and Belgium.

The Monthly Accounts of the Trade and Navigation of the United Kingdom have been completely revised and greatly enlarged and improved since 1856. The most important new feature is the introduction of the principal countries from and to which the chief articles of British Trade are imported and exported; and a Quarterly Account of the Declared Value of the British Exports to *each* Foreign Country and British Possession has been appended during the present year.

In addition to these improvements steps have been taken for ensuring the issue of the Monthly and Annual Trade Publications at the earliest possible period, the Government having authorized several measures in various departments for expediting the collection and compilation of the particulars contained in them.

The most important work published by this Department, "The Annual Statement of the Trade and Navigation of the United Kingdom," is now issued within ten months after the close of the year to which it relates, but will, in future, most probably be issued at a much earlier date.

The Annual Trade Volume of France is usually published within eight months after the close of the year.

The *Meteorological* Department of the Board of Trade, under Admiral FitzRoy, was established early in 1855.

During so short a period as has since elapsed much production could not be expected, as time has been devoted to the collection and preparation of materials rather than to their publication, yet some advance has been made.

A series of fourteen large wind charts for most parts of the world has been compiled.

A quarto volume of reduced and tabulated observations, with various papers and diagrams, has been published; and a full report of the state and progress of the work undertaken has been laid before Parliament.

More than two hundred ships in the mercantile navy, and nearly all the ships of war in commission, are now supplied with tested and reliable instruments, besides books and charts, at the public cost.

The captains of most of those merchant ships, and some of the men of war, have already returned a large number of well-filled and valuable meteorological registers.

There are in use about sixty collecting books, adapted to the various subjects and parts of the world.

(Papers by Admiral FitzRoy and by J. H. Brown, Esq., Registrar of Merchant Seamen, forwarded through Mr. Fonblanque, were handed in.)

The meeting, at the instance of the President, expressed its regret at the absence of Mr. Fonblanque through illness.

M. HEUSCHLING reported that the Belgian census, placed on a new and better footing, was taken on 31st December 1856. The general results are already published. They were deduced from the returns by a sub-commission under the direction of M. Visschers. An improvement in reporting the causes of death is now in operation. In continuation of the decennial report on the whole statistics of Belgium an annual report is to be published; the first number has recently appeared. Belgium still maintains its eminent position by these publications.

On the *third day* Baron Lasser presented, on the part of the Minister of the Interior (Baron Bach), a work by Dr. Wurzbach, in two volumes, on the statistics of Austrian literature, and expressed a hope that the statistics of literature might figure in the next program.

M. LEGOYT, who is at the head of the statistical department in France, and has greatly contributed to the recent progress of statistics in that empire, then gave a rapid sketch of the official statistics. Napoleon I., who

happily defined statistics—as the complement of the financial budget—*the budget of things* (*budget des choses*), founded an organized statistical department in 1802. Since the peace it has published several remarkable works; some periodical, others occasional. The periodical publications include (1) the finance returns, (2) the conscription reports, (3) the return of French imports and exports, and other foreign commercial returns, (4) the mineral statistics, (5) a return of the Minister of Finance of the tonnage and voyages of vessels upon navigable rivers, (6) colonial statistics, (7) statistics of friendly societies, which through the encouragement of the government have grown up everywhere lately as if by enchantment, (8) criminal statistics (since 1825), (9) the judicial statistics of the civil courts, (10) prison statistics. Among the occasional publications M. Legoyt named the returns of births, deaths, and marriages, as well as the census; which have latterly been greatly extended and improved. The results of the census of 1856 will be published early in 1858. A new series of agricultural statistics is in the press, and will show the progress of agriculture since 1840. The statistics of insanity 1851–3 will speedily appear; so will returns of the charitable institutions, and their results. The railway statistics have been published on the plan laid down in the Paris program. To Count Dubois, who was present, M. Legoyt gave the credit for this admirable work. The valuable educational return is unfortunately only published at rare intervals. The great map of France by the *Corps Impériale d'Etat Major* is nearly completed; reduced lithographic copies will soon be published. The statistics of the charitable institutions, by M. Davenne, as well as the celebrated work on the industrial statistics of the capital, by M. Horace Say, are full of interest, and have a semi-official character.

"J'espère," M. Legoyt concluded, "que vous y aurez trouvé la preuve que l'intérêt scientifique occupe au moins une part égale, si ce n'est supérieure, à l'interêt administratif, dans ces enquêtes si nombreuses, si variées. Je crois d'ailleurs ne rappeler qu'un fait généralement admis, en disant que la France ne s'isole jamais dans ses travaux; qu'elle n'y cherche jamais une satisfaction exclusive à des besoins purement nationaux. Je crois, au contraire, qu'il est de la mission providentielle de mon pays d'embrasser toujours le plus vaste horizon possible, et de mettre sans cesse son activité, son intelligence, son ardente initiative au service des intérêts generaux de l'humanité."* (Applause).

The Scandinavians are by nature statisticians. Sweden has undoubtedly taken the lead of all other countries in its official statistics, which date from the middle of the last century. The tables have from the first been clear and well arranged, the facts well selected. Improvements, however, are required by the progress of statistical science; and the Swedish government has shown every disposition to maintain its position, by establishing a new statistical office on a liberal footing, at the head of which Dr. BERG is placed. The report of the population returns of 1851–5, founded on the old basis, is in several respects new, and shows that Dr. Berg understands and is able to maintain the statistical fame of Sweden; which supplied Dr. Price with data for the construction of life tables at a time when England and France were entirely destitute of such materials. The report on the cholera, the extension of meteorological stations along the telegraph lines, the geological survey at the expense of the state are also noteworthy in Sweden.

Denmark and Norway, like Sweden, have able statists. Privy councillor DAVID, of Denmark, stated that the results of the census of 1855,

* M. Legoyt has published his statement, of which I have availed myself in this analysis. For the statements of the other official Delegates, I have relied on the reports in the *Wiener Zeitung*, which though brief are, I believe, substantially correct.

and the commercial and shipping statistics of 1854 would speedily be published; the latter would exhibit the destinations* of vessels, which had so often been desired. The learned Danish statist exhibited a means of expressing the density of population by means of curves.

Dr. ENGEL, the representative of Saxony, has placed the official statistics of that country among the first in Germany; but he unfortunately made no report of the recent progress of Saxon statistics.

Ministerial Councillor DIETZ reported briefly on the state of statistics in the Grand Duchy of Baden, and the encouragements to their study.

Bavaria, by its publications under the direction of State Councillor BARON HERMANN, still maintains in statistics a distinguished place in Germany. It has a grand map of the kingdom in 100 sheets, and a reduced topographical map of 15 sheets, Every proprietor can have for a small sum any of the 26,000 field maps. Among the most interesting recent publications of Bavaria, Baron Hermann enumerated the reports on charities; on the properties of public institutions and communes; on criminal and police statistics (1849–55); on the post offices, railroads, steam navigation; on mines, manufactures, and salt works.

The President BARON CZŒRNIG concluded these communications by a luminous exposition of the recent progress of statistics in Austria. The question of the nomenclature of fatal diseases was discussed in Paris. The Minister of the Interior referred the nomenclature to the Vienna College of Physicians, who approved of its principles. It figured in the program and would be reported on by the first section. The railway accidents of 1856 are already compiled on the plan laid down at Paris; so are also the statistics of the roads of Carinthia. Since 1853 the reports of the state railways have been most judiciously planned and most comprehensive: they have been applied for by other states. Under actual circumstances it has been held that agricultural statistics could be most satisfactorily collected through the agency of the agricultural societies, which exist in almost all the crown provinces. The Minister of the Interior has taken active steps in the matter, and in consequence many of the societies are already at work. I may cite for instance the returns of Bohemia, which are under collection by 2000 delegates in every part of that kingdom. Similar returns have already been collected in Styria and in Moravia. M. Fleury in an elaborate report lays it down, that in order to render the foreign trade returns really international, four things are necessary. (1.) The publication must immediately follow the close of each period. The Austrian Government has endeavoured to give effect to this principle: within *six weeks* of the end of the year the quantities and values of all exports and imports are published. This is not an easy matter in a monarchy which has to employ six hundred custom-houses on its long boundary line extending from the Bukowina to Lombardy. Each office makes monthly returns to the statistical department where they are grouped and published monthly, with a summary at the end of the year. A more elaborate report showing the countries from and to which goods proceed, with comparisons between the returns of past periods, appears every year within twelve months of its close.

(2.) The annual returns should all date from January 1st. The Austrian returns did date from November 1st, which is the beginning of the official year; but in compliance with the vote of the Paris Congress, the returns of 1855 are for that year, and will continue to be for the civil years dating from January 1st.

(3.) The same weights and measures should be used to express quantities. The Austrian Customs are now levied under the same laws as

**frachtfahrt.* The return which appears to be here referred to is intended to show the countries from which vessels arrive and to which they are bound.

those of the Zollverein, and the pound weight in use is the half-*kilogram*. So that the metrical system is recognized in Austria.

(4.) A general summary showing the commerce of state with state should accompany the report. Such a *resumé* is found in the Austrian report.

The subject of judicial statistics is before one of the sections. I merely remark that the formulary for civil cases is completed; it is most comprehensive. The form for criminal statistics, with additions and improvements is in readiness. The judicial registry of criminals and of their crimes in their parishes, with a view to the distinction of recommittals is in operation in Austria as well as in France; and negotiations are in progress to procure the necessary interchanges with France and the German states. The forms in use at lock-up houses and prisons have been improved, so that they show the period of arrest and imprisonment in conformity with the recommendations of the Paris Congress. A return has been called for by the Minister of Commerce of the savings banks and insurance societies in the whole empire.

The statistics of the city of Paris are well known. They are models. The common council of the city of Vienna, to show how highly it appreciates the Congress, and how much it is gratified with its meeting here, determined to undertake a work of the same character; the first part will give the members an idea of the undertaking which the municipality has entered on, and has placed under the guidance of the Burgomaster. When complete it will give as exact an idea of our city as we can at present furnish.

I come now to the last part which occupied the Congress in Paris. I mean the establishment of a central statistical commission in each state. Though this point may not have attracted the greatest attention, its importance becomes every day more evident, whether we consider the difficulties inherent in statistical inquiries, or the practical bearing of their results on the measures of governments. The conviction must ere long be universal, that without the establishment of a central commission or some such institution, the national statistics will reach a point at which they will remain stationary. And, Gentlemen, to stand still, is to retrograde. (Und meine Herren, stationär bleiben ist Rückschritt).

The half of this institution has existed, as far as Austria is concerned, since 1840 in our statistical office; which is so organized that it embraces all branches of the administration, and if all branches have not yet been dealt with, this is due to the inadequacy of the force at our disposal. But it cannot undertake the second and far weightier part of statistical operation. And if statistics are to obtain that influence which they merit in the Government; if they are to draw strength from the practical life of the Government, and from the life of the people; then must statistics enter into integral union with the Government. But a central commission, in which the several branches of the administration are represented, is the sole practical means of rendering this union durable and fruitful. So in Austria the way to the establishment of a central statistical commission is opened, but the final decision has not yet been taken.

Allow me to mention certain measures which also show the estimation in which the Austrian Government holds the Congress. Three ministers have undertaken important works, which, without the stimulus of this meeting in Vienna would probably never have been begun, would not have been begun so soon, or would have been carried out on plans far less comprehensive.

I take first the Home Office. There is probably no operation which will influence the national economy more than the disburthening the land in Austria, the disencumbrance of the soil in so large a portion of Central Europe, where now entirely new principles prevail in commerce and in agriculture. If it is important to ascertain the nature of the incumbrances

of the land, it is also difficult, and indeed next to impossible for anybody but this special department to comprehend all its intricate details. We must thank the Minister therefore for the work, of which you have received the first part, and of which the second will shortly appear. A most comprehensive work on the statistics of companies and societies of every kind in Austria has been prepared by our honourable colleague Professor Von Stubenrauch. A third work on the literary statistics of Austria has already been brought under your notice.

The Finance Minister has also, out of the rich archives of his office, placed before you a mass of valuable documents, which I hesitate not to say, are the most perfect of the kind that have ever appeared. I am not aware that in reference to the finance and the national economy of any state, such detailed information has ever yet been published. You can only understand the full value of this work when it is in print, and you receive the copy which I can venture to promise shall be placed in the hands of every member of the Congress. (Applause).

The Minister of Justice has also directed the criminal statistics of the year 1856 to be compiled and printed for your use.

His Excellency the Minister of the Interior has been pleased to declare that when the first section has reported on the returns of the causes of death, and the Congress has come to a decision, a law shall be immediately promulgated carrying into effect a measure based on that decision (great applause). It is I believe, gentlemen, the first time that one of the results of your labours has been carried into immediate effect in a great and powerful State.

His Excellency the Minister of Justice also announces his intention, if the form for criminal returns receives your sanction, to submit it to His Majesty as the basis of the regulations under which the returns are to be compiled.

I will now pass rapidly in review the works upon which the Statistical Department has been engaged during the two last years. I have first to announce to you the completion,—or, at least, the partial completion,—of a work which has been 16 years in hand; it is the ethnographical map of the monarchy, with a commentary in three quarto volumes, lying on the table.* The map is complete, and is published in two forms. The commentary embraces the eastern lands and the Archduchy of Austria. The German portions of the State are nearly completed. The Southern and the Northern Selavonic States stand over for the present.

To this a work is attached for which I bespeak your attention; as I know you will all take an interest in the progress of this great State, in the midst of which you are assembled. The work, to which I have given the title "*Neugestaltung von Oesterreich*" (Reforms,—or, rather, the New-formation,—of Austria), constitutes an integral part of the Ethnography, but will appear also in a separate volume. Its object is to show in a compressed form all the great reforms, mightily working in the life of the people, as well as in the organization of the State of this kingdom, from the year 1848 down to the present day; also, where it is possible, to exhibit the result of these reforms in Statistical Tables.

I can now only notice the continuation of the great series of tabular returns,—of which *nine* parts are completed,—in which the returns of schools and educational institutions have been subjected to an entire revision. The map of the Danube is on the table, so are several numbers of our statistical memoirs, containing a complete account of the iron manufactures of Carinthia and Carniola, a commencement of the industrial statistics of Austria, with maps and other matters, which, as they are before you, I will not enumerate, for I have already occupied too much of your time.

* "Ethnographie der Oesterreichischen Monarchie" von Karl Freiherrn von Czœrnig. *Wien*, 1857.

The proofs which the able president's speech contained of the activity of the Imperial Government in carrying on statistical research, and in promoting the objects of the Congress, elicited loud and long continued applause.

In any European scientific association Italy should naturally hold a high place. The learned Professor Nardi of Pavia and the Chevalier Zuccagni Orlandini of Tuscany represented Italy at the Congress. Bertini of Turin, who represented Sardinia in Brussels and Paris, is dead: he was a learned, zealous, sincere, honest man. His place was not supplied by any other representative from a State which has published a valuable series of official statistics.

The absence of the Chevalier Dieterici, the official delegate who represented Prussia at previous Congresses, was greatly regretted, as it deprived the Congress of one of its most estimable members, and left a country which has contributed most essentially to the extension of statistics, without a representative. Professor Schubert and Mr. Otto Hübner of Prussia took an active part in the proceedings.

Count Ribaldo said a few words about the statistics of Chili; and expressed a hope that the Government of that country may be invited to send a representative to the next Congress.

The absence of a representative from the United States of America was remarked and regretted, as some questions in science, particularly in relation to jurisprudence, might be elucidated by the statistics of that country.

It was recommended in the course of the proceedings that the following questions should figure in the program of the next Congress:

(1.) The Statistics of Literature.
(2.) The Statistics of Agriculture and Forest-culture.
(3.) The Statistics of Banks and Credit Institutions.

And an amendment was moved by Privy Councillor Dr. Engel, on a motion of Professor Wolowski, to the effect that the official delegates to the next Congress should constitute a special commission, out of which a committee should be named to draw up a report to be read with the oral statements of the several delegates relative to the execution of the recommendations of the previous Congress. This amendment was carried.

Proceedings of Committees.

The work of the Congress was distributed among six committees, which sat in the mornings, and reported successively to the Congress in its general sittings.

The absence of Mr. Fonblanque was here sensibly felt, as I could not attend the meetings of all the committees and make the necessary preparations for the general sittings of the Congress. Mr. Samuel Brown, the delegate of the Statistical Society, rendered me most important assistance; and Mr. Nassau Senior, who happened to be in Vienna, joined and assisted in the committees.

His Excellency the Chevalier von Toggenburg, Minister of Industry, Commerce, and Public Works was president of the preliminary commission.

Of the Congress as definitively organized, Baron Czœrnig was chosen President; the Official Delegates were elected Vice Presidents; Dr. Ficker and M. Louis Debrauz were secretaries.

Section I.—Statistics of Mortality.

Presidents: Dr. Theodore Helm, Medical Councillor, Director of the General Hospital, Vienna; Dr. William Farr. *Secretary:* Dr. Maurice Haller.

This section discussed in detail the measures necessary to secure accurate returns of the causes of death. It revised the nomenclature,

which is substantially the same as that which has been in use in England for some years. It came to no decision on the question of classification, except that it should be for the present left in the hands of the Statistical Departments. The Section decided :—

(1.) That the cause of every death should be investigated, and that it should be returned by the medical attendant. In Austria the medical attendant is bound by law to return the cause of every death which has happened in his practice ; and the body is inspected by a sanitary officer (todtenbeschauer).

(2.) Where no such officer exists, the Section laid it down that in the interests of sanitary police and of justice, it should be ascertained through medical agency, if possible, whether death had actually occurred from natural causes, or otherwise ; and where the person deceased had not been attended by a medical man, the cause of death should be especially investigated by the sanitary inspector, or a person appointed for the purpose.

(3.) That the several States should adopt the forms of certificate appended to the report.

(4.) That the above measures would be illusory, unless in each State a special medical and statistical department were created for the classification, verification, and discussion of the facts in periodical reports.

The three first decisions of the Section were adopted by the Congress ; the fourth, at the suggestion of MM. Legoyt, Farr, and Stubenrauch, and after some remarks by MM. Hopf, Varrentrapp, and Helm, was modified : it assumed this form—that the materials collected in each State should undergo revision by a medical officer specially appointed, and be by him arranged and discussed in reference to their bearings on statistics, medicine, and the public health.

Forms for statistics of societies and institutions for the benefit and relief of the sick were proposed by Dr. Helm—the excellent President of the Section—and by Dr. Stubenrauch. Dr. Seligmann, who is acquainted with English scientific literature, made some excellent general remarks on the statistics of the infirm, and on the statistics of epidemics. Dr. Riedel discussed the statistics of lunatic asylums. Several of the forms which they proposed were approved. I must refer to the official report for details.

II. *The Section of Judicial Statistics* adopted, with some slight modifications, forms of criminal returns which had been prepared by the Austrian Commission. The Austrian Government was requested to put itself in communication with the Governments of other countries, in order to obtain the information necessary to enable the next Congress to discuss and settle forms for the statistics of the civil courts. The Chevalier Hye inserted an interesting note on judicial statistics in the program ; Baron Czœrnig, in another note, ably discussed the statistics of the actual distribution of real property and its charges, as well as of the annual changes in its possession and its burthens. The administration of justice on one uniform system in the various provinces of Austria was carried out in 1856 ; and the judicial statistics of that year were laid before the Congress. Professor Wolowski, of Paris, read the highly interesting report of this committee on the subdivisions of landed property, —its burthens,—and their changes.

III. *Section for Financial Statistics. President:* RITTER VON HOCK. *Vice-Presidents :* Governmental Councillor, SCHUBERT of Prussia ; M. CABANSKY, Secretary to the Imperial Academy of St. Petersburgh. *Secretaries:* Dr. OTTO HÜBNER, of Berlin ; M. BUCHATSCHEK, of Vienna.

An able clear note by the President on this great question appeared in the program ; with a classification of the various items of income and expenditure. Besides these items a classified tabular view of the public

property and debt, at the beginning and at the end of the year, was declared to be indispensable in the program.

The difficulties of accurate financial statements were discussed in the Section; and the illusions and imperfections of nearly all the current financial statements were discussed with a view to future amendments.

Baron Hermann, of Bavaria, pointed out, in an acute and comprehensive statement, the numerous latent expenses which never figured in the budgets of states. Thus, under the conscription system men are compelled to serve for less than the market price of their labour; which is indicated by the sum required to obtain a substitute. Then consider the amount of taxation which the consumers pay under the various vicious systems of protection.

The report and the forms of this Section deserve to be carefully studied.

IV. *Section. Statistics of Industry.*—Baron Czernig was the President of this Section. He wrote the comprehensive introduction to the subject in the program, embodying the decisions of a preliminary committee, which consisted among others of Baron Czœrnig, the President and the Secretary of the Vienna Chamber of Commerce, Professor Jonak, and several eminent manufacturers.

The classification in *eight groups and thirty-four classes* of industrial products appears to be practical and well-considered; it is treated in the first part of the notice. In the second part of the paper the means are discussed of determining by a general method the quantity and the value of the industrial products of each class. The method described was tried twelve years ago in Austria; and the results were afterwards confirmed by exact inquiries for fiscal purposes. The first part of a new inquiry, conducted on the same principles, is published. The third point had reference to industrial maps, of which the Austrian Statistical Department exhibited specimens at the Universal Exhibition in Paris. The program contained also a classification of the raw materials of industry into three groups, seventeen classes, and several subordinate sections. This part of the classification, which appears to be excellent, was, as it appears to me, on inadequate grounds, not passed by the Section.

M. Engel and M. Visschers were the reporters of the Fourth Section.

V. *Section. Statistics of Education.*—The introduction to the proposed comprehensive form was drawn up by Dr. Springer. The sectional report proposed a few amendments, and a condensation of the original proposals. It was written by Dr. Ficker and Professor Nardi. The returns will furnish much valuable information; but the classification may be further improved by a separation of the facts which can be expressed in figures, and recorded in Tables, from the rest of the required information.

VI. *Section. Connection of Statistics with the Natural Sciences: Ethnographical Statistics.*—His Excellency Baron Baumgartner was the President of this Section, which comprehended among its members some of the most distinguished men of science in Austria, such as Hauslab, Ettingshausen, Kreil, Simony, Unger, Fitzinger, Hauer, and Fritsch, besides M. Quetelet and other foreign members. The work of this Section was in the hands of masters; it was new, and it was full of interest. It enumerated in a classification: (1) The elements with which the natural sciences must furnish statistics to enable that science to represent in the most complete form the various manifestations of social life. I will give here the definition of statistics—so often attempted—by Baron Baumgartner: "Statistics," he says, "embraces the facts having relation to social life, and deduces from them a representation of the condition of a given State; or it compares the analogous political forces of different communities. The facts of which the statistician has need are drawn from the observation either of nature and its forces in action, or of

human action." Baron Hauslab happily adds, "It is a characteristic of statistics that it deals with measures, numbers, comparisons. It may be safely said, that where there are no ratios there is no statistics." (Ohne verhältnisszahlen, könnte man sagen, gibt es keine statistik). He discusses the applications of cartography and of graphic representation to statistical purposes with much ingenuity and method. Baron Czœrnig treats of ethnography in its statistical bearings.

PROCEEDINGS *at the* LAST MEETING.

The business of the Committees was brought to a satisfactory close by their reports. The only thing to regret in the arrangements was the late delivery of the program, which was placed in the hands of the members on their arrival in Vienna. By way of compensation, the program was ably drawn up by the members of the Austrian Commission. The principal subject (causes of death) with which the first section dealt, had been discussed before, and had been practically illustrated in England. The other questions were not only discussed in the program by experienced men, but were exemplified by works which the Austrian Government had undertaken and laid before the Congress in a form more or less complete. The notices and the works were substantial contributions to statistical science. The program was not a mere proposal, but a discussion of the general applicability of principles on which great statistical operations in Austria had been conducted.

The first meeting of the Statistical Congress was held in Brussels under the auspices of the Belgian Government. Upon the invitation of the French Government the second Congress was held in Paris under the Presidency of one of the Imperial Ministers. Vienna, the seat of the Austrian empire, had been visited; and here a general feeling prevailed at the close of the proceedings in favour of holding the next meeting in London. Mr. Fonblanque and I had been authorized by the President of the Board of Trade—Lord Stanley of Alderley—to express, if the Congress thought it desirable to meet in London, the readiness of Her Majesty's Government to receive them in the year 1859, the meetings being biennial; at the close of the proceedings on Saturday accordingly I gave the intimation, which was very favourably received. The subjoined extract from the official report of the proceedings shows precisely what took place in reference to this matter:

EXTRAIT du procés verbal de la Cinquième Séance du Troisième Congrès International de Statistique. Samedi, ce 5 Septembre 1857.

M. William Farr, délégué du Gouvernement Anglais, prend la parole en ces termes, "Monsieur le Président, Il nous reste à décider de quelle manière notre quatrième session sera organisée. À ce sujet j'ai une proposition à faire à l'assemblée. Elle est à peu près la même que celle qu'a voté le Congrès de Paris. Elle est ainsi conçue: 'Le Congrès est invité à décider, que la commission Autrichienne d'organisation sera chargée, comme fut la commission Française en 1855, de déterminer dans quel pays et à quel époque se tiendra la quatrième session du Congrès International de Statistique.'"

Le Président met aux voix la proposition de M. William Farr; elle est adoptée à l'unanimité.

M. William Farr, prenant de nouveau la parole, ajoute: "Ma proposition étant adoptée, j'ajouterai que M. Fonblanque et moi nous sommes chargés de déclarer, que si la commission Autrichienne décide qu'il est dans l'intérêt de la science que le Congrès tienne sa prochaine session à Londres notre Gouvernement veut bien le recevoir.

"Permettez moi d'y ajouter quelques mots de ma part. Je ne vous dirai pas que si vous venez à Londres la réception qui vous sera faite, sera aussi brillante qu'elle a été dans les villes impériales de Paris et de Vienne, *mais j'ose* dire qu'elle sera aussi cordiale (très bien!). L'Angleterre est

hospitalière. Nos amis MM. Quetelet et Visschers vous diront que la première idée de notre Congrès, inauguré d'abord à Bruxelles, a pris naissance à l'Exposition internationale qui se tenait à Londres en 1851. Croyez bien que la statistique a encore dans cette ville des amis dont l'amour pour cette science et pour ceux qui la cultivent n'est pas refroidi. Londres est un peu loin de Vienne, et elle n'est pas si centrale quant à l'Europe que Paris, mais, messieurs, il faut bien que le Congrès et la statistique élargissent leurs bornes, et s'étendent au monde entier.

"Sur nos îles occidentales, mises en avant dans l'océan, des représentans des divers États de l'Amérique et des Colonies lointaines peuvent facilement se joindre à nous. Mais, dit-on, l'Angleterre est séparée du reste de l'Europe. Eh bien, messieurs, dans des temps déjà reculés, les Italiens, les Français, les Allemands, les peuples du Nord n'ont pas craint de passer les mers, et de fonder des colonies en Angleterre. Venez donc, messieurs, en Angleterre voir les enfants de vos ancêtres (applaudissemens). Et aux races diverses dont nous n'avons pas de représentans en Angleterre, je dirai, Venez nous voir en frères (très bien!); vous êtes certains de trouver l'accueil le plus cordial (très bien! très bien!)"

Le Président Baron de Czœrnig.—"Je ne manquerai pas de porter à la connaissance de la commission organisatrice la proposition et le désir exprimés par M. William Farr; et je suis certain que l'accueil que l'une et l'autre ont déjà reçu dans cette enceinte aura de l'écho parmi les membres de la commission internationale."

M. Quetelet then moved votes of thanks to His Imperial Majesty for the gracious reception which he had deigned to give the Congress in Vienna; to His Majesty's Ministers, and particularly to His Excellency Ritter von Toggenburg, Minister of Commerce; and, finally, to the President, Baron Czœrnig, for the careful and impartial manner in which he had conducted the proceedings.

M. Visschers expressed the thanks of the foreign members for the reception which they had received in Vienna. Two languages had been employed with perfect ease, and without fatigue to any of the members.

After three cheers for the Emperor the third meeting of the Congress was dissolved.

Some Indirect Results *of the* Congress.

Without having for their direct object the promotion of peace or commercial advantages of any kind, the Congresses in Brussels, Vienna, and Paris have not only contributed to the progress of statistical inquiry, but have indirectly produced some beneficial results. Delegates from nearly every state of Europe have been brought together to discuss measures for carrying on inquiries by which their respective countries may be enabled to contribute most effectually to social science, and thus, as nations, become better known to themselves and to the rest of the world. The effect of this must be salutary; for the more people know of each other the more intimately they grow connected in interest and affection; ignorance being undoubtedly the main cause of the prejudices, the hostilities, and the isolation of civilized nations. The Congress, in the spirit illustrated at Vienna, not only tends to increase the friendly relations of governments with each other, but it engages them more or less in the promotion of a great international work,—the completion of the statistics of Europe.

The good effects of the union of the various countries of Europe in promoting a common object were seen at the great Exhibition of 1851; and they have not yet subsided on the continent. "Nobody," the Prince Consort then happily remarked, "who has paid any attention to the peculiar features of our present era will doubt for a moment that we are living at a period of most wonderful transition, which tends rapidly to accomplish that great end, to which, indeed, all history points, the realization of the unity of mankind. Not a unity which breaks down the limits and levels

the peculiar characteristics of the different nations of the earth; but rather a unity the result and product of those very national varieties and antagonistic qualities." *

Austrian Hospitality.

After the business of the Congress was over the members were carried along the Vienna and Trieste railway by Neustadt to the Semmering, one of the greatest engineering works in Austria. The train ascends on a rising serpentine line over viaducts, and through many tunnels nearly up to the top of one of the Alps, when it plunges into a long tunnel opening over a valley of Styria on its way to Trieste. The traffic of Trieste is thus put in direct communication with Vienna and the Danube. This railway is also a military road, by which an Austrian army can now be speedily carried into Italy, and marched into Lombardy. At the entrance of the tunnel refreshments were spread under tents. After enjoying the views of the Alps around the Schneeberg and of the fine country extending to Vienna, the members were conveyed back to that city. On Monday the official delegates, with a few of the private members, had the honor to be presented by the Minister of Commerce to His Majesty the Emperor; who was pleased to express his pleasure at receiving the Congress in Vienna, and his approbation of their labors generally. He then in passing round addressed a few friendly words to each of the delegates. The principal foreign members were honored with invitations to dine with His Excellency the Minister of Commerce on Saturday or Monday. Prince Sapieha, who is well known, and is well acquainted with England, was one of the guests. The hospitality of Austria was not exhausted, for on Tuesday the members of the Congress were borne by a fine steamer of the Danube company (capital £3,000,000) down the magnificent river to Pressburg, in Hungary; where the members had been invited and were hospitably entertained by the mayor. Here, among other matters upon the tables, were labelled specimens of all the finest Hungarian wines; which might, I think, compete with any of the other wines in the English market. Besides Tokay there are several wines, cheap in the country, of very fine quality. Hungarian cattle, after having been driven to Vienna, are conveyed by railway to Hamburgh, where some are slaughtered for salting, and some are sent to England. Other commodities of equal value may probably now be transported from Hungary, with a profit, over the same route.

Baron Czœrnig undertook the management of the affairs of the Congress; and as he is an able administrator, or what in England would be called "a good man of business," the arrangements were admirable. He not only presided in the chair to the general satisfaction, but rendered the foreign members many friendly offices, and by his entire conduct won their esteem.

His Excellency, Sir Hamilton Seymour, in the most obliging manner, rendered me all the assistance which I required.

I have the honor to be,
Sir,
Your very faithful servant,
WILLIAM FARR.

General Register Office,
December 1857.

To
The Registrar-General.

* Address at the Mansion House, March 21st, 1850, in "Addresses delivered on different Public Occasions by His Royal Highness the Prince Albert;" published by the Society of Arts, 1857.

[The following Index furnishes a reference to the *Number* of each DISTRICT in the topographical arrangement adopted in the Tables of Abstracts contained in the Report, the numbers running consecutively from 1 to 623.* In forming the alphabetical arrangement the principle is adopted of placing compound names in the order in which they are pronounced: thus, East Ashford will be found under the letter E, and *not* under A, as Ashford, East.]
